ENVIRONMENTAL AND SOCIAL IMPACT ASSESSMENT PROJECT REPORT FOR THE PROPOSED CONSTRUCTION OF BUKANI WATER PAN AND AQUACULTURE DEVELOPMENT, SAMIA SUB-COUNTY, BUSIA COUNTY.

KENYA CLIMATE SMART AGRICULTURE PROJECT (KCSAP) FUNDED BY WORLD BANK.

In accordance with Environmental Management and Coordination Act (EMCA), CAP 387, Environmental (Impact Assessment & Audit) Regulation, 2003.

9.0 Introduction	70
ENVIRONMENTAL AND SOCIAL MANAGEMENT PLAN FOR THE AQUACULTURE 83	
REFERENCES i	

1.0 Introduction

Kenya's economy is largely rural-based and heavily dependent on its natural resource base. Water resource usually play a key role in the economy for all sectors including urban and rural consumption, energy generation, agricultural, livestock development, industry and tourism. However, Kenya is classified by the U.N. as a chronically water-scarce country. The country's natural endowment of freshwater is highly limited, with an annual renewable freshwater supply of about 647 cubic meters per capita, significantly below the 1,000m³ capita set as the marker for water scarcity.

In the recent past, there has been a shift in the rainfall regime in the county towards uncertainty and erratic and sometimes heavy downpours within a short period and prolonged droughts. In addition, there has been a rapid growth in human population thereby putting more pressure on natural resources including the issue of food security that can sustain this ever increasing population. One way to increase food security is proper utilization of water resource in the form of development of aquaculture and to increase community resilience to climate change.

The current level of water use for aqua-culture can be witnessed by a number of fish ponds with protective nets in Busia County. The farmers have requested for technical and financial assistance for the design and implementation of a water pan and fish ponds. However this water shall also be used by mankind and livestock watering. The expected spin-off benefits include increases in level of income, employment opportunities and food self-sufficiency.

The UN Sustainable Development Goals is framework that guides country's plans, priorities and investments to reduce poverty and promote development. Some of the goals include; Goal 1 which calls for ending extreme Poverty in all forms, Goal 2: End hunger, achieve food Security and improve nutrition and Promote Sustainable Agriculture, Goal 6: Ensure availability and Sustainable Management of water and Sanitation for by year 2030. This goal 6 is in line with Article 43 of the National Constitution of Kenya 2010 which provides for the access to clean and safe water for all. Similarly, one of the flagship activities for Kenya Vision 2030 is aimed at achieving universal access in water and sanitation services by 2030. Goal 15 calls for the Protection, Restoration and Promotion of Sustainable use of terrestrial Ecosystems and halt and reverse land Degradation and halt Biodiversity loss.

In line to the above sustainable development goals, the Kenya Climate Smart Agriculture is a project being implemented in Busia County under the Department of Agriculture and animal Resources and funded by the World Bank. The project entails construction of Bukani water pan of 17,000m² with a capacity of 26,000m³ and development of 130 fish ponds in Buloma Sub-location, Namboboto Nambuku ward, Samia Sub-County, Busia County and is expected to benefit more than 6,000. The project's specific objectives include;

- i. To Build the community resilience to Climate Change
- ii. To Increase fish production
- iii. To Increase food security
- iv. To increase income for the community members
- v. To Provide water for the community for various uses
- vi. To improve the living standards of the community

The Kenya Government policy on projects of such nature and scale, programmes or activities requires that an Environmental and Social Impact Assessment study be undertaken/ report be prepared at the planning stages of the proposed undertaking to ensure that significant impacts on the community and environment are taken into consideration during the design, construction, operation and decommissioning of such projects, programmes or activities.

Therefore, in compliance with the law and to avoid unnecessary conflicts that may retard development in the county, the proponent undertook this Environmental Impact Assessment and incorporated environmental and social concerns as required by EMCA CAP 387 Laws of Kenya.

Plate 1: Proposed Site for the Construction of Aquaculture, Bukani, Samia Sub-County.

1.2 Objectives of the EIA

Environmental Impact Assessment (EIA) is a process having the ultimate objective of providing decision makers with an indication of the likely environmental consequences of a proposed activity. The main objectives of this EIA therefore include the following:

- i. To identify and evaluate the significant environmental impacts of the project
- ii. To evaluate the impacts of the various alternatives on the project
- iii. To propose mitigation measures for the significant negative impacts of the project on the environment.
- iv. To generate baseline data for monitoring and evaluating impacts, including mitigation measures during the project cycle.
- v. To seek the views and concerns of all stakeholders in regards to the proposed project.
- vi. To highlight environment issues with a view to guiding policy makers, planners, stake holders and government agencies to make environmentally and economically sustainable decisions
- vii. To incorporate Environmental Management Plans and monitoring mechanisms

1.3 Terms of Reference (TOR)

The following are the Terms of Reference for the proposed project as developed by the lead expert in consultation with the project proponent;

- Assessment and description of location/site, objectives, scope, nature of the proposed project,
- ii. Analysis of the proposed project activities during the proposed project cycle; construction, operation, decommissioning phases,
- iii. Establish the suitability of the proposed project in the proposed location,
- iv. Review and establish all relevant baseline information as will be required by NEMA (Physical, Biological and Social Cultural and economic) and identify any information gaps,
- v. Description and analysis of policy legal and institutional framework including but not limited to Kenyan policies, laws, regulation and guidelines which have a bearing on the proposed project and will also serve as benchmarks for monitoring and evaluation, and future environmental audits,
- vi. In-depth description of the proposed project and associated works together with the requirements for carrying out the works,
- vii. Analysis of the designs, technology, procedures and processes to be used, in the implementation of the works,
- viii. Consultation and Public Participation (CPP): Identify key stakeholders and affected persons; hold a public meeting and provide /collect written evidence i.e. minutes,
- ix. Identify and analyze proposed project alternatives including but not limited to: Scale and extent; project site alternatives, no project alternatives, design alternatives, material alternatives and technologies alternatives,
- x. Identify, predict and carry out in-depth analysis all actual potential and significant impacts on flora, fauna, soils, air, water, the social, cultural and community settings; the direct, indirect, cumulative, irreversible, short-term and long-term effects anticipated to be generated by the proposed project, both positive and negative throughout the project cycle,
- xi. Recommend sufficient mitigation measures for all the potential negative impacts identified,
- xii. Analyze occupational health and safety issue associated with the proposed project,
- xiii. Develop an Environmental Management Plan proposing the measures for eliminating, minimizing or mitigating adverse impacts on the environment, including the cost, timeframe and responsibility to implement the measures.

1.4 Scope of the report

The EIA report will involve the following;

- a) A description of the project
- b) Documentation of all baseline information
- c) Socio-economic study to get the views of different stakeholders using:
 - i. Questionnaires
 - ii. Interviews
 - iii. Public meeting/Barraza
- d) Review of the policy, legal and administrative framework
- e) Prediction of any sources of conflicts and making relevant recommendations
- f) Assessment of both the positive and negative impacts of all environmental and components
- g) Developing mitigation measures for the negative impacts identified
- h) Designing of an Environmental Management Plan for the project
- i) Designing a monitoring and evaluation plan
- j) Examining the projects phases, stages and activities to be undertaken and integrating them with environmental characteristics
- k) The monitoring programmes, parameters and procedures to be put in place for control and corrective actions in case of emergencies shall also be examined.

1.5 Methodology

The methodology used for preparation of this EIA report is stated in the steps below;

- a) Screening of the project, a process that identified the project as being among those requiring EIA under schedule 2 of the EMCA CAP 387.
- b) A scoping exercise that identified the key issues to be addressed in the assessment.
- c) Documentary review on the nature of the proposed activities, policy and legal framework, environmental setting of the area and other available relevant data/information.
- d) Public participation and discussions with the local community, proponent and the project team.
- e) Physical investigation of the site and the surrounding areas using a pre-prepared checklist identifying possible environmental and human safety issues that are likely to be affected,
- Reviewing the proposed project designs and implementation plan/schedules with a view to suggesting suitable alternatives,
- g) Developing an EMP outline with responsibilities, schedules, monitorable indicators and time frames among other aspects,

h) A comprehensive report including issues as listed in the Environmental (Impact Assessment) Regulations 2003.

The data used for developing the ESIA can be categorized into two, primary and secondary data, as tabulated below;

Type of Data	Source of Data		
Secondary data	Published books, official government		
	documents and statutes, plans, reports and documentation from members of the project		
	team.		
Primary Data	Formal/informal interviews, field		
	observations, pictures, questionnaires, views		
	from resident attendees during the public		
	baraza and input from the project team.		

Table 1: Data collection methods

1.6 EIA Organization and Structure

The EIA was carried out to full completion within a period of three weeks from the date of undertaking. The Consultant (Lead Expert) coordinated the day-to-day functions and any related institutional support matters.

1.7 Reporting and Documentation

The Environmental and Social Impact Assessment Study Report drafted from the findings was compiled in accordance with the guidelines issued by NEMA for such works and was prepared and submitted by the proponent for review. The Consultant ensured constant briefing of the client during the exercise. Description plans and sketches showing various activities are part of the Appendices.

1.8 Responsibilities and Undertaking

The Consultant undertook to meet all logistical costs relating to the assignment, including those of production of the report and any other relevant material. The consultant arranged for own transport and travels during the exercise. On the site of the proposed development project, the proponent provided a contact person(s) to provide information required by the Consultant. The proponent also provided site plan(s) showing roads, and the actual sizes of the sites, details of raw materials,

proposed process outline and anticipated by-products. The output from the consultant includes the following:

- An Environmental Impact Assessment report comprising of an executive summary, assessment approach, baseline conditions, anticipated impacts and proposed mitigation measures,
- An Environmental Management Plan outline, which also forms part of the report recommendations.

1.9 Methodology Outline

Since the intended development and use of the facility will be in line with what exists in the surrounding areas, an Environmental and Social Impact Assessment Study report would be seen to be adequate to draw attention to the potential positive and negative environmental impacts; provide mitigation measures for negative ones and enhance the positive impacts. The general steps followed during the assessment were as follows:

- 1. Environment screening, in which the project was identified as among those requiring environmental impact assessment under schedule 2 of EMCA, CAP 387.
- 2. Environmental scoping that identified the pertinent environmental issues
- 3. Desk Stop studies and interviews
- 4. Physical inspection of the site and surrounding areas
- 5. Reporting.

Environmental Screening

This step was applied to determine whether an environmental impact assessment was required and what level of assessment was necessary. This was done in reference to requirements of the EMCA, CAP 387, and specifically the second schedule. Issues considered included the physical location, sensitive receptors in close proximity to the site and the nature of anticipated impacts. It was concluded that the proposed project falls within the category of projects under the second schedule of EMCA that requires an EIA to be done before implementation.

Environmental Scoping

The Scoping process helped narrow down onto the most critical issues requiring attention during the assessment. Environmental issues were categorized into physical, natural/ecological and social, economic and cultural aspects. The site history and the facilities in close proximity to the site were considered during this stage.

Desktop Study

This included documentary review on the nature of the proposed activities, project documents, designs policy and legislative framework as well as the environmental setting of the area among others. It also included discussions with managers and design engineers as well as interviews with staff and neighbors.

Site Assessment

Field visits meant for physical inspections of the site characteristics and the environmental status of the surrounding areas to determine the anticipated impacts were conducted. It also included further interviews with staff, neighbors and key stakeholders.

Reporting

In addition to constant briefing on the environmental aspects and impacts pertinent to the project, this Environmental and Social Impact Assessment Study Report was prepared and shared with the client. The contents were presented for submission to NEMA as required by law.

2.1 Project background

The project is Kenya Climate Smart Agriculture, funded by the World Bank and implemented by the department of agriculture and animal resources, County Government of Busia. It entails the construction of water pan, development of aquaculture, construction of office store, putting up a chain link fence and development of a dyke to control flooding of aquaculture.

2.2 Project Location

The project is located in Buloma Sub – location, Namboboto Location, Namboboto //Nambuku Division, Samia District of Western Province. It is located at 36N 619983 m E, 35322 m N UTM. It is 43 (Forty Three) kilometers from the Busia County headquarters through Funyula market.

2.3 Project Description

The project entails construction of water Pan, development of pond based Aquaculture of Nile Tilapia, construction of dyke, office store and putting up of chain link fence around the aquaculture. The average size per fish pond will be 300M³ and will have a Dyke to control flooding.

The project work consist water pan construction, 130 fish ponds and pipe network. The water pan covers an area of about 17,000 M² and it will have a capacity of 26,000M³ and will benefit 6,000 people directly, including livestock.

The project has been proposed in response to building community resilience to climate change, water scarcity in the area, a decline in fish stocks in Lake Victoria, an increase in demand for fish in Kenya and in Busia County due to consumers recognizing its nutritional value and to diversify community sources of livelihood. Fish farming offers significant economic benefits and does not rely on a depleting natural resource.

The goal of KCSAP is to develop a vibrant aquaculture industry and provision of reliable water that generates sustainable incomes, food security, and employment through the following objectives;

- a) Increasing agricultural production
- b) Building resilience to climate change
- c) Reduction of greenhouse gas emission.

2.3.1 Pan Design

Pan axis

From the map of the area, we can able to see the highest and the lowest points of the site. The contours show the constriction where the embankment wall would require the least fill material.

Embankment

From the pan axis, it can be depicted that the pan will be on the upper point of the area, hence the embankment is in the straight line. This shows the location of the pan axis which was selected in a way to minimize the fill material. The best location is shown on the map.

Embankment height

The height was obtained from the elevation difference of the area.

The height was obtained from the elevation difference of the area.

Highest point= 1145.3728m

Lowest point= 1143.5149m

Height (Z) =1.8579m (<5m, Ok.)

Crest width

Crest width was calculated from the embankment height as shown below.

W = (Z/5) + 3

3.5m used because machinery is used in the construction of the pan.

Crest length

The alignment was selected basing on the contour layout to give the shortest crest length and allow for the economical location of the spillway route. The crest length taken to be 118m from the dimension of the pan.

Pan freeboard

It was determined by calculating the following parameters; wind set up, significant wave height and wave run up.

Assuming a maximum wind speed of 130km/day for Bukani

Wind set up

The fetch and depth found from the pan size, shown above thus wind set up calculated using the formula:

Zs= (Vw2*F)/(63,200*d) meters

= 0.0054m

Significant wave height 24

Using the wind speed and the fetch, significant wave height (Zw) can be found as;

Zw = 0.005Vw1.06*F0.47 (m)

= 0.28m

Wave run up

To calculate the wave run up, wave period calculated as;

tw= 0.32Vw0.44*F0.28 (min)

= 2.55min

Using wave period, wavelength calculated as shown;

λ= 1.56tw2

= 10.2min

The ratio of significant wave height to wavelength (Zw/λ) should not exceed 0.7, hence wave run up is finally calculated as;

 $Zr = 0.7*(Zw/\lambda)$

= 0.019 m/min

Required minimum pan freeboard

Freeboard calculated by summing up wind set up, significant wave height and wave run up

Freeboard = Zs + Zw + Zr

= 0.304m

Note- A freeboard of 1m allowed. The value of the freeboard calculated above shows that, the wave action on the pan has negligible effects.

Embankment slope

From the soil map, the soil has granular distribution. Given embankment height being equal to 4m, hence slope selected from the table below;

Upstream slope= 2.5,

Downstream slope= 2

Embankment Slopes

Embankment height	Fill material	Slope	
		Upstream	Downstream
≤5m	Good granular	1/2.5	1/2
5m to 10m	Good granular	1/2.5	1/2
	Clay	1/2.5	1/2.5

Table 2: Guidelines for the Design, Construction and Rehabilitation of small dams and pans in Kenya (Kenya- Belgium water development programme Nairobi, June 1992).

Embankment protection

To protect the embankment against wave action and erosion, grassing of both downstream and upstream slope is required.

Fencing also of the pan helps to prevent the animals getting in to the pan, this is accomplished by building water troughs outside the pan and fed using delivery pipes of 5cm in diameter. Also protected by planting stabilizers.

Again latrines and bathrooms will be built around the place so that as people bring their livestock, they can take a bath also.

Spillway design

For the case of design, its proposed to have a pan height of 4m.It is a medium risk pan. For this reason, a return period of 10 years was adopted. A cut spillway with a general trapezoidal section

was designed. The spillway is located on the entrance of the pan, two spillways on opposite sides are designed.

Earthwork volume

The volume of earth to be excavated and compacted was calculated from the drawings attached. Excavation Volume = 13,000m3.

Storage capacity of the pan = 26,000m3.

More fine details of the specifications and features of the proposed project can be obtained from the drawings (attached in the appendix section).

2.3.2 Fish Pond Design

Each pond will cover an area measuring a total of 300 m2. The general features of the pond to conform as instructions shown in the figures 1 & 2 below,

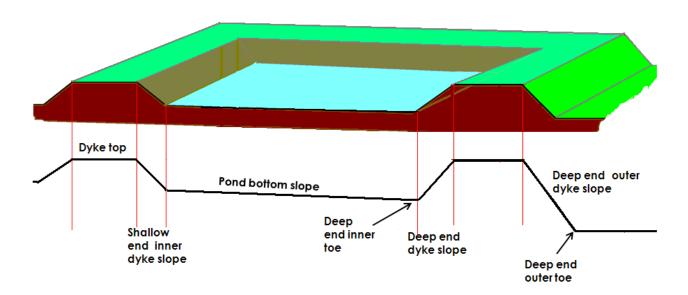

Figure 1: A cross section of each earthen fish pond showing the pond profile

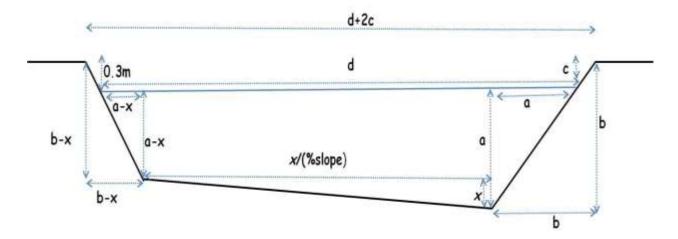

Figure 2: Length wise section of each 1:1 fishpond showing the relationship between various measurements

a = Water depth at deep end

b = Total pond depth at the deep end

c = Free board

d = Water surface length

During pond construction, the following will be observed:

- a) Accurate measurements of all dimensions MUST be taken
- b) Dykes MUST be compacted to achieve the required stability and water retention
- c) Elevation equipment (e.g. a spirit level) **MUST** be used to get the right elevations of the dykes and slopes
- d) The pond **MUST** be constructed in such a way it can be filled and drained easily

Costing for the Ponds

- 1. Each pond will require 100 man days to excavate, move earth and compact soil which translates to 10 casuals each hired for 10 days
- 2. Estimated cost of labour is K.shs 400 per man day
- 3. Total estimated cost of constructing 100 ponds is pegged at 10000 man days @ 400 per man day
- 4. Total cost of pond construction to completion of ponds without the drainage is pegged at K.shs 4,000,000/=

2.4 Construction Inputs

The project inputs include the following:

- i. Construction raw materials i.e. sand, cement, stones, clay materials among others. All these should be obtained from within the locality.
- ii. Construction machines including machinery such as trucks, concrete mixers, and tools and other relevant construction equipment. These will be used for the transportation of materials, clearing of the site and construction debris. Most of the machinery will use petroleum products to provide energy.
- iii. A construction labour force of both skilled and non-skilled workers.

2.5 Construction Activities

2.5.1 Description of the Project's Construction Activities

2.5.1.1 Pre-construction Investigations

The implementation of the project's design and construction phase will start with thorough investigation of the site's biological and physical resources in order to minimize any unforeseen adverse impacts during the project cycle.

2.5.1.2 Clearance of Vegetation.

The site has some vegetation cover including papyrus, grass and few planted trees. The proponent shall ensure as many indigenous trees as possible are used for re-vegetation as well as conserving the trees along the pan boundary.

Plate 2: Available trees next to the proposed pan construction and aquaculture site

2.5.1.3 Excavation and Embankment Works

Excavation will be carried out to prepare the site for construction of the pan. This will involve the use of heavy earthmoving machinery such as excavators and associated equipment's.

2.5.1.4 Landscaping

To improve the aesthetic value or visual quality of the site once pan construction ceases, the Proponent will carry out landscaping. This will include leveling the site and planting trees. It is noteworthy that the proponent will use plant species that are available locally preferably indigenous ones for landscaping.

2.6. Description of the Project's Operational Activities

2.6.1 Toilets and wash rooms

The toilets to be constructed as described in this report will be used by the community during the operation of the pan

2.6.2 Solid Waste

The proponent takes cognizance of waste that will be generated during the construction, and operation of the project. An integrated solid waste management system will be applied at all phases of the project. First, the proponent will give priority to Reduction at Source of the waste materials. Under this option, the proponent will implement a solid waste management awareness programme for the community.

Secondly, Recycling and Reuse of the waste will be the second alternative in priority. Under these options the proponent plans to a management system of separating waste at the source. The recyclables will be sold to waste buyers.

2.7 Description of the Project's Decommissioning Activities

Decommissioning is an important phase in the project cycle and comes last to wind up the operational activities of a particular project. It refers to the final disposal of the project and associated materials at the expiry of the project lifespan. If such a stage is reached, the proponent needs to remove all materials resulting from the decommissioning from the site. The following should be undertaken to restore the environment:

- a) The site should be well landscaped by flattening the mounds of soil
- b) Planting indigenous trees
- c) All the equipment should be removed from the site

- d) Fence and signpost unsafe areas until natural stabilization occurs
- e) Backfill surface openings if present

2.8 Products

2.7.1.1 By-Products

The by-products will be disposed-off as follows:

- a) **Soil:** The soil generated during excavation will be reused within the project.
- b) **Excess sand and ballast piles:** These can be used for future construction activities e.g. renovations. Upon completion of the project, these will be moved by the contractor to a suitable yard.

2.8 Project Budget and Duration

The proposed project is estimated to cost Kenya shillings, Twenty Four Million.

3.1 Project Location

The proposed project is located in Bukani, Namboboto Nambuku Ward, Samia Sub-county, Busia County.

3.2 Climate

Busia County fall within the Lake Victoria Basin and it has a bi-modal rainfall pattern. The long rains season falls between March and May while the short rains season falls between September and November with the rainfall amount ranges between 750mm and 1,800mm per annum. The average temperature is 22°C. The altitude is undulating and rises from about 1,130m above sea level at the shores of Lake Victoria to a maximum of about 1,500m in the Samia. Samia Sub-County is relatively dry and experiences mean annual rainfall of approximately 500mm.

3.3 Infrastructure

Due to rapid population growth, provision of basic infrastructure for all has become an important concern of development planners in Busia County. The area is served by the all-weather road. The nearby feeder roads are all in good condition.

The project area has access to essential utility services including; roads and telecommunication. Thus, such infrastructural background assures the area of the potential to expand and diversify.

3.4 Geology

The geology of the area comprises mainly of rocks of the Archaean greenstone belt of western Kenya, especially the metavolcanics of the Samia origin. The soils in the project location are generally good and this is good for farming activities. The catchment area for the pan is approximate by 30 ha.

3.4.1 Hydrogeology

The hydrology of an area is determined by the nature of the parent rock, structural features, weathering processes and precipitation patters. Ground water occurrence in Busia County is essentially determined by the geology of the area, including the tectonic features and permeability of the rocks.

The aquifer in this area is expected within the weathered and fractured portions of the granites below the soil cover. More potential zones are also in the fault zones. Recharge is accomplished from natural precipitation (rain), which infiltrates into aquifers (weathered and/or fractured zones). In terms of the well inventory, there are no boreholes drilled in the vicinity of the investigated area.

Some hand dug wells are reported in the area. The wells are perennial but with reduced yield during the prolonged dry spell. Therefore shallow aquifers are expected in the weathered layers of granite below the soil layer.

3.5 Biological

3.5.1 Flora and Fauna

The vegetation within the area is influenced by the relatively warm temperatures, moderate rainfall and good soils. The area has papyrus, grass, tress as vegetation. The moderate rainfall supports agriculture, thus during the wet season, the surrounding area is covered by crop vegetation such as maize, beans, sweet potatoes and bananas.

Plate 3: Vegetation at the proposed site for the project, Buloma.

The animals of importance noted in the location of the project area were mainly domestic and included; indigenous livestock, goats, sheep and poultry.

3.6 Settlement

Busia County is located in western Kenya; it borders Lake Victoria to the South West, the Republic of Uganda to the West, North and North East, and the following Counties; Bungoma and Kakamega to the East, and Siaya to the South East and South. It covers an area of 1,695 square km. The

projected population of the county stands at 900, 946 with a population density of 439 people per km² as per the 2009 Census report. The settlement pattern is evenly distributed.

3.7. Socio- Economic and Related Activities

Economic activities in the area include subsistence farming mainly maize, beans and Bananas and small scale fishing from the nearby river. Apart from crop farming, animal rearing is also an activity in the area and these include cows, sheep, goats and poultry.

Plate 4: Maize growing around the proposed project site in Bukani, Namboboto Nambuku Ward

3.8 Social Amenities

The project area has access to basic social amenities like hospitals, churches, markets and other educational facilities.

3.9 Character of surrounding Developments

Right from inception, concerted efforts have been put in place that a blend of both business premises, administrative offices, private farms and private residential homes is realized in the proposed project. The proposed development will thus blend with the existing neighborhood without causing any conflicts in Bukani area.

4.1 Introduction

There is a growing concern in Kenya and at global level that many forms of development activities cause damage to the environment. Development activities have the potential to damage the natural resources upon which the economy is based. Environmental and social Impact Assessment is a useful tool for protection of the environment from the negative effects of developmental activities. It is now accepted that development projects must be economically viable, socially acceptable and environmentally sound.

According to Sections 58 and 138 of the Environmental Management and Coordination Act (EMCA) CAP 387 of the laws of Kenya and Section 3 of the Environmental (Impact Assessment and Audit) Regulations 2003 (Legal No. 101), requires an Environmental Impact Assessment project/study report prepared and submitted to the National Environment Management Authority (NEMA) for review and eventual Licensing before the development commences. This was necessary as many forms of developmental activities cause damage to the environment and hence the greatest challenge today is to maintain sustainable development through sustainable use of natural resources without interfering with the environment.

4.2 Relevant Policies

There are a number of policies that are pertinent to this project, chief of which is the constitution of Kenya. A brief description of the policies is given bellow.

4.2.1 World Bank Operational Policy 4.01-Environmental Assessment.

This policy used in the World Bank projects to identify, avoid, and mitigate the potential negative environmental impacts associated with Bank lending operations. The purpose of Environmental Assessment is to improve decision making, to ensure that project options under consideration are sound and sustainable, and that potentially affected people have been properly consulted. The EA undertaken for the project revealed that the investment will result in low to moderate impacts on both social and biological environment; therefore, this project assigned category B, according to WB classification.

4.2.2. World Bank Operational policy OP 4.37 (Safety of Dams)

This policy is used in the World Bank projects to identify, avoid, and mitigate the potential negative environmental impacts associated with dams. For the life of any dam, the Bank requires that appropriate measures are taken and sufficient resources provided for the safety of the dam. Because there are serious consequences if a dam does not function properly or fails, the Bank is concerned about the safety of new dams it finances. Small dams are normally less than 15 metres in height. This Bukani dam is less than 15 metres in height falls under the Bank category of small dams. This category includes, for example, farm ponds, local silt retention dams, and low embankment tanks. For small dams, generic dam measures designed by qualified engineers are usually adequate. During construction and operation phases of this small dam, adequate measures will be ensured to comply with this safeguard and ensure dam safety as this small dam triggers this safeguard.

4.2.3 The Constitution of Kenya 2010

The Constitution of Kenya, promulgated into law on 27 September 2010 is the supreme law of the Republic of Kenya and binds all persons and all State organs at all levels of government. It provides the broad framework regulating all existence and development aspects of interest to the people of Kenya, and along which all national and sectoral legislative documents are drawn.

In relation to environment, Article 42 of Chapter 4, the Bill of Rights, confers to every person the right to a clean and healthy environment, which includes the right to have the environment protected for the benefit of present and future generations through legislative measures, particularly those contemplated in Article 69, and to have obligations relating to the environment fulfilled under Article 70.

Chapter 5 of the new constitution provides the main pillars on which the 77 environmental statutes are hinged and covers "Land and Environment" and includes the aforementioned articles 69 and 70. Part 1 of the Chapter dwells on land, outlining the principles informing land policy, land classification as well as land use and property. Part 2 of the Chapter directs focus on the environment and natural resources. It provides for a clear outline of the state's obligation with respect to the environment. The Chapter seeks to eliminate processes & activities likely to endanger the environment. Article 69 states that

1) The State shall:

- Ensure sustainable exploitation, utilization, management and conservation of the environment and natural resources, and ensure the equitable sharing of the accruing benefits;
- Work to achieve and maintain a tree cover of at least ten percent of the land area of Kenya;
- Protect and enhance intellectual property in, and indigenous knowledge of, biodiversity and the genetic resources of the communities;
- Encourage public participation in the management, protection and conservation of the environment;
- Protect genetic resources and biological diversity;
- Establish systems on environmental impact assessment, environmental audit and monitoring of the environment;
- Eliminate processes and activities that are likely to endanger the environment;

In conformity with the Constitution of Kenya 2010, every activity or project undertaken within the Republic of Kenya must be in tandem with the state's vision for the national environment as well as adherence to the right of every individual to a clean and healthy environment. The proposed development project is a development activity that will utilize sensitive components of the physical and natural resources hence need for a clearly spelt out environmental management plan to curb probable adverse effects to the environment. The proponent will therefore adhere to the provisions of the Environmental management plan provided in this report to ensure the publics' and employee's right to a clean and safe environment is not infringed.

4.2.4 Kenya Vision 2030

Kenya Vision 2030 is the country's development blueprint covering the period 2008 to 2030. It aims at making Kenya a newly industrializing 'middle income country providing high quality life for all its citizens by the year 2030. The vision has been developed through an all-inclusive stakeholder consultative process, involving Kenyans from all parts of the country. The vision is based on three 'pillars' namely; the Economic Pillar, the Social Pillar and the Political Pillar. The vision 2030 comes after the successful implementation of the Economic Recovery Strategy (ERS) for Wealth and Employment Creation 2003-2007.

The proposed project is in line with the economic and social pillars of Kenya vision 2030 and therefore its implementation will contribute to Kenya's realization of the objectives set in the Kenya Vision 2030.

4.2.5 Sessional paper No. 10 of 2014 on the National Environment Policy (Gok, 2014)

The policy's major objective is to harmonize environmental and developmental concerns to ensure sustainability. Furthermore, this policy ensures that environmental issues are taken into consideration before the commencement of development policies, programmes, plans and projects. The proposed project is therefore consistent with the Sessional Paper No. 10 of 2014.

4.2.6 Physical Planning Policy

The current policy governs the development and approval all building plans as provided for in the Physical Planning Act (Cap 286). The proposed project will be subjected to the provisions of this policy and legislation.

4.2.7 Public Health Policy

The prevailing public health policy calls upon the project proponent to ensure good measures have been put in place. The proposed development has been designed by professional engineers and environmentalists and as such will have all amenities/utilities that are essential for safeguarding public health for all people using the facilities during the construction, operational and decommissioning phases of the project. The proponent will adhere to the provisions of the relevant Act of parliament; Public Health Act (CAP 242).

4.2.8: The National Wildlife Conservation and Management Policy, 2018

The policy takes cognizance of the value of wildlife in Kenya and appreciates the need to sustainably manage wildlife for the benefit of both present and future generations. This Policy proposes a broad range of measures and actions responding to the wildlife conservation challenges and seeks to balance the needs of the people of Kenya with opportunities for sustainable wildlife conservation and management countrywide

4.2.9: Forest Conservation and Management Policy, 2016

The policy underscores the need to sustainably manage forest resources within Kenya. The policy acknowledges that forest conservation and management has faced a number of challenges in Kenya; the increasing demand for land and forest resources, inadequate funding that constrains the provision of public services among others. This Policy proposes a broad range of measures and actions responding to the challenges faced by the forest sector. The proponent will adhere to the tenets of this policy at all phases of the project.

4.2.10: Wetlands Policy

The policy acknowledges that wetlands highly productive ecosystems and that they perform many functions that maintain the ecological integrity of the systems and also provide many goods and services. The policy also underscores the functions and benefits provided by wetlands and their significance for the general public as they support agriculture, tourism, industry, and biodiversity conservation, social economic and cultural activities. The policy decries the deterioration of wetland quality and quantity due to mismanagement.

The Policy seeks to ensure that the plans and activities of the government, private developers and wetland stakeholders promote conservation and sustainable/ wise use of wetlands. It provides a framework for actions to improve institutional and organizational arrangements, address legislation and government policies, increase knowledge and awareness of wetlands and their values, review the status of and identify priorities for wetlands in a national context, and address problems at particular wetland sites.

4.2.11 National Policy for Disaster Management, 2009 (G.o.K, 2009e)

- The policy aims at Promoting the mainstreaming of disaster management and climate change into development planning and management for sustainability
- Providing for well-structured participation of society in disaster management by integrating traditional coping strategies into the DM systems
- Supporting climate change disaster risk reduction initiatives

2.2.12 National Policy on Occupational Safety and Health, 2012

The policy aim is;

- Affirmative action for addressing workplace gender biases in occupational safety and health
- Develop and implement workplace code of practice on HIV and AIDS at work
- Develop guidelines for provision of facilities for persons with disabilities and other special needs in workplaces
- Prevention of environmental pollution

4.3 Institutional Framework

There are 21 institutions, which deal with environmental issues in Kenya. Some of the key institutions include National Environmental Management Authority (NEMA), the Department of

Resource Surveys and Remote sensing (DRSRS), the Water Department, The Kenya Forest Service (KFS), the Kenya Wildlife Service (KWS), the Kenya Forestry Research Institute (KEFRI), the National Museums of Kenya (NMK), the Kenya Marine and Fisheries Research Institute (KMFRI), the Kenya Agricultural Research Institute (KARI) among others. There are also local and international NGOs.

While implementing the project, both the proponent and the contractor will have to work in liaison with a number of these institutions when dealing with issues within the jurisdiction of the institutions.

4.3.1 National Environmental Council (NEC)

EMCA 1999 No. 8 part iii section 4 outlines the establishment of the National Environment Council (NEC). NEC is responsible for policy formulation and directions for purposes of EMCA; set national goals and objectives and determines policies and priorities for the protection of the environment and promote co-operation among public departments, local authorities, private sector, non-governmental organizations and such other organizations engaged in environmental protection programmes. It also performs such other functions as assigned under EMCA

4.3.2 National Environmental Management Authority (NEMA)

The objective and purpose for which NEMA is established is to exercise general supervision and coordinate over all matters relating to the environment and to be the principal instrument of the government in the implementation of all policies relating to the environment. A Director- General appointed by the president heads NEMA. The Authority shall:

- Co-ordinate the various environmental management activities being undertaken by the lead agencies and promote the integration of environmental considerations into development policies, plan, programmes and projects with a view to ensuring the proper management and rational utilization of the environmental resources on a sustainable yield basis for the improvement of the quality of human life in Kenya.
- Take stock of the natural resources in Kenya and their utilization and consultation, with the relevant lead agencies, land use guidelines.
- Examine land use patterns to determine their impact on the quality and quantity of the natural resources.
- Carry out surveys, which will assist in the proper management and conservation of the environment.

- Advise the government on legislative and other measures for the management of the environment or the implementation of relevant international conservation treaties and agreements in the field of environment as the case may be.
- Advise the government on regional and international environmental convention treaties and agreements to which Kenya should be a party and follow up the implementation of such agreements where Kenya is a party.
- Undertake and co-ordinate research, investigation and surveys in the field of environment and collect and disseminate information about the findings of such research, investigation or survey.
- Perform such other functions as government may assign to the Authority or as are incidental or conducive to the exercise by the authority of any or all of the functions provided under EMCA.

However, NEMA mandate is designated to various committees.

The contractor and the client will work in liaison with NEMA in getting various permits, licenses, approvals and generally in complying with the provisions of EMCA 1999 and any other subsidiary legislation under EMCA 1999.

4.3.3 Public Complains Committee (PCC)

The Committee performs the following functions:

- Investigate any allegations or complaints against any person or against the authority in relation to the condition of the environment in Kenya and on its own motion, any suspected case of environmental degradation and to make a report of its findings together with its recommendations thereon to the Council.
- > Prepare and submit to the Council periodic reports of its activities which shall form part of the annual report on the state of the environment under section 9 (3) and
- > To perform such other functions and excise such powers as may be assigned to it by the council.

4.3.4 National Environment Action Plan Committee

This Committee is responsible for the development of a 5-year Environment Action plan among other things. The National Environment Action Plan shall;

- i. Contain analysis of the Natural Resources of Kenya with an indication as to any pattern of change in their distribution and quantity over time.
- ii. Contain analytical profile of the various uses and value of the natural resources incorporating considerations of intergenerational and intra-generational equity.

- iii. Recommend appropriate legal and fiscal incentives that may be used to encourage the business community to incorporate environmental requirements into their planning and operational processes.
- iv. Recommend methods for building national awareness through environmental education on the importance of sustainable use of the environment and natural resources for national development.
- v. Set out operational guidelines for the planning and management of the environment and natural resources.
- vi. Identify and recommend policy and legislative approaches for preventing, controlling or mitigating specific as well as general diverse impacts on the environment.
- vii. Prioritize areas of environmental research and outline methods of using such research findings.

4.3.5 Standards and Enforcement Review Committee

This is a technical Committee responsible for environmental standards formulation methods of analysis, inspection, monitoring and technical advice on necessary mitigation measures. Standards and Enforcement Review Committee consists of the members set out in the third schedule to the Environmental Management and Co-ordination Act.

4.3.6 National Environmental Tribunal (NET)

This tribunal guides the handling of cases related to environmental offences in the Republic of Kenya. If disputes to the proposed project arise, they are supposed to be presented here for hearing and legal direction.

The EMCA, CAP 387, Institutional Framework

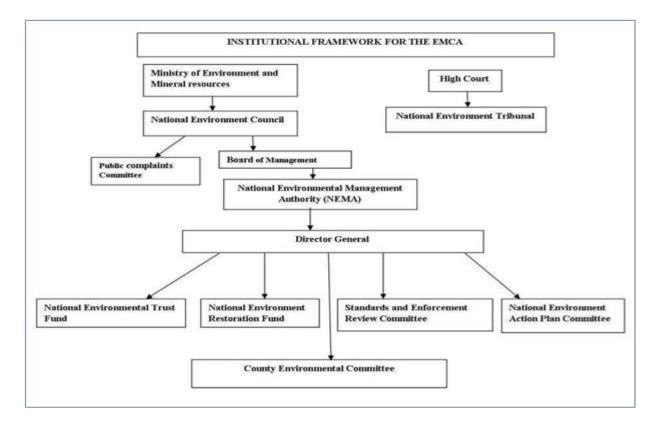

Figure 3: The EMCA , Institutional Framework

4.4 Legal Framework

Kenya has several statutes that govern environmental standards and quality. Most of these statutes are sector specific covering issues such as public health, planning, air quality, agriculture, water quality, and land use. This section seeks to bring to light statutes and legislation pertinent to the development of the proposed development in Bukani herein referred to as the proposed project.

4.4.1 The Environmental Management and Coordination Act (EMCA), CAP 387

The Environmental Management and Coordination Act (EMCA) CAP 387, provides for the legal framework for the management of the Kenyan environment. Under the EMCA, all proposed projects that are likely to have significant impact on the environment according to the Second Schedule will undergo an Environmental Impact Assessment (EIA) while projects already in place will undertake annual Environmental Audits (EA). It aims at coordinating environmental protection activities in the country. In its preamble, the Act states that every person in Kenya has a right to a clean and healthy environment. According to section 58 of the Act (EMCA), second schedule 9 (i), and the environmental (Impact Assessment and Audit) Regulations, 2003, all new enterprises and projects must undergo Environmental Impact Assessment (EIA).

It is in line with this provision that the proponent appointed EIA experts to undertake an Environmental and Social Impact Assessment and prepare a report in respect of the proposed development. This addresses the requirement as the project activities are likely to have negative environmental impacts. This will ensure the Proponent observes continuous improvement on environmental, health and safety management and takes appropriate measures to mitigate any adverse impacts to the environment and the surrounding communities that the project may have during its implementation and operation.

Part VII, Section 68 of the same Act requires operators of projects or undertakings to carry out environmental audits in order to determine level of compliance with statements made during the EIA. The audit report should be submitted to NEMA. The proponent shall submit an Environmental Audit report in the first year of operation to confirm the efficacy and adequacy of the Environmental Management Plan.

EMCA CAP 387, has several subsidiary legislations that were enacted to ensure effective implementation of the Act. A few regulations that are pertinent to the proposed project are described below.

4.4.1.1 The Environmental Management and Coordinating (Water Quality) regulation 2006

The Regulations provides for sustainable management of water resources including prevention of water pollution and protection of water sources (lakes, rivers, streams,' springs, wells and other water sources).

It is an offence under Regulation No.4 (2), for any person to throw or cause to flow into or near a water resource any liquid, solid or gaseous substance or deposit any such substance in or near it, as to cause pollution.

Regulation No. 11 further makes it an offence for any person to discharge or apply any poison, toxic, noxious or obstructing matter, radioactive waste or other pollutants or permit the dumping or discharge of such matter into the aquatic environment unless such discharge, poison, toxic, noxious or obstructing matter, radioactive waste or pollutant complies with the standards for effluent discharge into the environment

Regulation No. 14 (1) requires every licensed person generating and discharging effluent into the environment to carry out daily effluent discharge quality and quantity monitoring and to submit quarterly records of such monitoring to the Authority or its designated representatives.

The proponent will have to ensure that appropriate measures to prevent pollution of underground and surface water sources are implemented throughout the project cycle.

4.4.1.2 The Environmental Management and Co-ordination (Waste Management) Regulations, 2006

The regulations provide details on management (handling, storage, transportation, treatment and disposal) of various waste streams including:

- Domestic waste,
- Industrial waste,
- Hazardous and toxic waste
- Pesticides and toxic substances
- Biomedical wastes and
- Radioactive waste

Regulation No.4 (1) makes it an offence for any person to dispose of any waste on a public highway, street, road, recreational area or in any public place except in a designated waste receptacle.

Regulation 5 (1) provides categories of cleaner production methods that should be adopted by waste generators in order to minimize the amount of waste generated and they include:

i.Improvement of production process through-

- Conserving raw materials and energy
- Eliminating the use of toxic raw materials and waste
- Reducing toxic emissions and wastes

ii. Monitoring the product cycle from beginning to end by-

- Identifying and eliminating potential negative impacts of the product
- Enabling the recovery and re-use of the product where possible
- Reclamation and recycling

iii.Incorporating environmental concerns in the design and disposal of a product

The Proponent shall ensure that the main contractor adopts and implements all possible cleaner production methods during the construction phase of the project.

Regulation 6 requires waste generators to segregate waste by separating hazardous waste from non- hazardous waste for appropriate disposal. Regulation 14 (1) requires every trade or industrial undertaking to install at its premises anti-pollution equipment for the treatment of waste emanating from such trade or industrial undertaking. Regulation 15 prohibits any industry from discharging or

disposing of any untreated waste in any state into the environment. Regulation 17 (1) makes it an offence for any person to engage in any activity likely to generate any hazardous waste without a valid Environmental Impact Assessment license issued by NEMA. Regulation 18 requires all generators of hazardous waste to ensure that every container or package for storing such waste is fixed with a label containing the following information:

- a) The identity of the hazardous waste
- b) The name and address of the generator of waste
- c) The net contents
- d) The normal storage stability and methods of storage
- e) The name and percentage of weight of active ingredients and names and percentages of weights of other ingredients or half-life of radioactive material
- f) Warning or caution statements which may include any of the following as appropriate--The words "WARNING" or "CAUTION"
- The word "POISON" (marked indelibly in red on a contrasting background;
- -The words "DANGER! KEEP AWAY / NO ENTRY FOR UNAUTHORIZED PERSONS" and

Regulation 19 (1) requires every person who generates toxic or hazardous waste to treat or cause to be treated such hazardous waste.

During the construction phase of the project, the Proponent shall ensure that the main contractor implements the above mentioned measures as necessary to enhance sound environmental management of waste.

4.4.1.3 The Environmental Impact (Assessment and Auditing) Regulations, 2003

The Environmental Impact Assessment exercise under the Act is guided by the Environmental Impact Assessment (Assessment and Auditing) Regulations of the year 2003, which was given under legal notice no. 101. The regulations stipulate the ways in which environmental impact assessment and audits should be conducted. The project falls under the second schedule of EMCA, CAP 387 section 58 (1), (4) that require an Environmental Impact Assessment report. As stipulated by the legal notice No. 101,2003, PART V, Section 31 (3((a) (i) and (ii) it is required that an environmental assessment be undertaken to provide baseline information upon which subsequent environmental control audit shall be based.

It is in the wake of these regulations that the proponent commissioned AWEMAC; a firm of experts to carry out an EIA exercise, write a report and submit it to NEMA with an aim of being awarded an EIA license.

4.4.1.4 Environmental Management and Coordination Controlled Substances Regulations, 2007 (Legal Notice No.73 of 2007)

The Controlled Substances Regulations defines controlled substances and provides guidance on how to handle them. This regulation mandates NEMA to monitor the activities of persons handling controlled substances, in consultation with relevant line ministries and departments, to ensure compliance with the set requirements. Under these regulations, NEMA will be publishing a list of controlled substances and the quantities of all controlled substances imported or exported within a particular. The list will also indicate all persons holding licenses to import or export controlled substances, with their annual permitted allocations.

The regulations stipulate that controlled substances must be clearly labeled with among other words, "Controlled Substance-Not ozone friendly") to indicate that the substance or product is harmful to the ozone layer. Advertisement of such substances must carry the words, "Warning: Contains chemical materials or substances that deplete or have the potential to deplete the ozone layer."

Producers and/or importers of controlled substances are required to include a material safety data sheet. Persons are prohibited from storing, distributing, transporting or otherwise handling a controlled substance unless the controlled substance is accompanied by a material safety data sheet. Manufacturers, exporters or importers of controlled substances must be licensed by NEMA. Further, any person wishing to dispose of a controlled substance must be authorized by NEMA. The licensee should ensure that the controlled substance is disposed of in an environmentally sound manner. These regulations also apply to any person transporting such controlled substances through Kenya. Such a person is required to obtain a Prior Informed Consent (PIC) permit from NEMA. In case the contractor deals with substances defined as "controlled substances" by the regulations, he will be required to comply with the regulations.

4.4.1.5 Environmental Management and Coordination (Conservation of Biodiversity regulations 2006)

Kenya has a large diversity of ecological zones and habitats including lowland and mountain forests, wooded and open grasslands, semi-arid scrubland, dry woodlands, and inland aquatic, and coastal and marine ecosystems. In addition, a total of 467 lake and wetland habitats are estimated to

cover 2.5% of the territory. In order to preserve the country's wildlife, about 8% of Kenya's land area is currently under protection.

The primary purpose of these regulations is to monitor the status and the components of biological diversity in Kenya and take necessary measures to prevent and control their depletion so as to ensure that conservation of biological diversity resources is achieved. Part II, section 4 of the regulations states that

- a) A person shall not engage in any activity that may- (a) have an adverse impact on any ecosystem;
- b) Lead to the introduction of any exotic species;
- c) Lead to unsustainable use of natural resources, without an Environmental Impact
 Assessment License issued by the Authority under the Act.

The contractor will ensure that the construction activities do not negatively impact on the existing ecosystems near the construction area.

4.4.1.6 Environmental Management and Co-ordination (Noise and Excessive Vibrations Regulations 2009

The regulations define noise as any undesirable sound that is intrinsically objectionable or that may cause adverse effects on human health or the environment. The regulations prohibit any person from making or causing to be made any loud, unreasonable, unnecessary or unusual noise which annoys, disturbs, injures or endangers the comfort, repose, health or safety of others and the environment. Article 13 2(d) of the regulations allows for construction work at night for public utility construction, construction of public works, projects exclusively relating to roads, bridges, airports, public schools and sidewalks, provided noise generated is not caused within a residential building or across a residential real property boundary where such noise interferes with the comfort, repose, or safety of the members of the public. The second Schedule of the Regulations provides for the maximum permissible level of noise at construction sites.

Facility	Maximum No	Maximum Noise level permitted (leq) in dB(A)			
	(leq) in dB(A)				
	Day (6	6.01am-	Night (6.01		
	6.00pm)		pm-		
			6.00am)		

Health facilities, educational institutions, homes	60	35
for disabled and residential areas		
Other areas	75	65

Table 5: Minimum and maximum permissible noise levels

4.4.1.7 Air Quality Regulations, 2008

This regulation is referred to as "The Environmental Management and Coordination (Air Quality) Regulations, 2008". The objective is to provide for prevention, control and abatement of air pollution to ensure clean and healthy ambient air. It provides for the establishment of emission standards for various sources, including as mobile sources (e.g. motor vehicles) and stationary sources (e.g. industries) as outlined in the Environmental Management and Coordination Act, 1999. It also covers any other air pollution source as may be determined by the Minister in consultation with the Authority. Emission limits for various areas and facilities have been set. The regulations provide the procedure for designating controlled areas, and the objectives of air quality management plans for these areas.

4.4.2 The Occupational Safety and Health Act, 2007

This is an act of Parliament to provide for the safety, health and welfare of workers and all persons lawfully present at workplaces, to provide for the establishment of the National Council for Occupational Safety and Health and for connected purposes.

The key areas addressed by the Act include;

- General duties including duties of occupiers, self-employed persons and employees.
- Enforcement of the act including powers of an occupational safety and health officer.
- Registration of workplaces.
- ➤ Health General Provisions including cleanliness, ventilation, lighting and sanitary conveniences.
- Machinery safety including safe handling of transmission machinery, hand held and portable power tools, self-acting machines, hoists and lifts, chains, ropes & lifting tackle, cranes and other lifting machines, steam boilers, air receivers, refrigeration plants and compressed air receiver.
- > Safety General Provisions including safe storage of dangerous liquids, fire safety, evacuation procedures, precautions with respect to explosives or inflammable dust or gas.

Under section 6 of this act, every occupier is obliged to ensure safety, health and welfare of all persons working in his workplace. The occupier shall achieve this objective by preparing and as often

as may be appropriate, revising a written statement of his general policy with respect to the safety and health at work of his employees and the organization and arrangements for the time being in force for carrying out that policy (Section 7).

To ensure machinery safety, every hoist or lift - section 63 and/ or all chains, ropes and lifting tackles - section 64 (Id), shall be thoroughly examined at least once in every period of six months by a person approved by the Director of Occupational Health and Safety Services. Similarly, every steam boiler - section 67 (8) and/or steam receiver section 68 (4) and all their fittings and/or attachments shall be thoroughly examined by an approved person at least once in every period of twelve months whereas every air receiver shall be thoroughly cleaned and examined at least once in every period of twenty four months or after any extensive repairs - section 69 (5). According to section 71 (3), every refrigeration plant capable of being entered by an employee also needs to be examined, tested and certified at least once in every period of twelve, months by an approved person.

During project implementation and operations, a large labour force will be required. This Act makes provisions for safety, health and welfare of persons upon which provision of their protection will be based. This will protect them against hazards to health and safety arising out of or in connection with their activities at work especially during the construction phase. This Act therefore safeguards workers welfare during the project phases by ensuring capacity building on Health and safety of workers at work place. In summary, this act will be used a guideline to ensure health and safety of workers is guaranteed. The proponent will ensure that the contractor includes in the contract adequate measures to promote safety and health of workers during all phases of the proposed project

4.4.3 The Public Health. Act (Cap. 242)

Section 115 of the Act states that no person/institution shall cause nuisance or, conditions likely to be injurious or dangerous to human health. Section 116 require local Authorities (currently County governments) to take lawful, necessary and reasonably practicable measures to maintain areas under their jurisdiction clean and sanitary to prevent occurrence of nuisance or condition liable for injurious or dangerous to human health.

Such nuisance or conditions are defined under Section118 waste pipes, sewers, drains refuse pits in such a state, situated or constructed as in the opinion of the medical leer of health to be offensive or injurious to health. Any noxious matter or waste water, discharged from any premises into a public street or into the gutter or side channel or watercourse, irrigation channel or bed not

approved for discharge is also termed as a nuisance. Other nuisances are accumulation of materials or refuse which in opinion of the medical officer of health is likely to harbor rats or other vermin.

Part XII Section 136 states that all collections of water, sewage, rubbish, refuse and fluids which permits or facilitate the breeding or multiplication of pests shall be termed nuisances and are liable to be dealt with in the manner provided by this Act.

4.4.4 The Physical Planning Act, 2012

The County governments are empowered under Section 29 of the Act to reserve and maintain all land planned for open spaces, parks, urban forests and green belts. The same Section, therefore, allows for prohibition or controls the use and development of land and buildings in the interest of proper and orderly development of an area.

Section 30 states that any person who carries out development without permission will be required to restore the land to its original condition. It also states that NO other licensing authority shall grant license for commercial or industrial use or occupation of any building without a development permission granted by the respective local authority.

Finally, Section 36 states that if in connection with a development application, local authority is of the opinion that the proposed development activity will have injurious impact on the environment; the applicant shall be required to submit together with the application an environmental impact assessment (EIA) report. EMCA, 1999 echoes the same by requiring that such an EIA is approved by the National Environmental management Authority (NEMA) and should be followed by annual environmental audits.

The proponent has complied with this provision by appointing EIA/Audit experts prepare and submit this Environmental Impact Assessment report to National Environmental management Authority (NEMA). Formal approval of drawings will be required prior to commencement of the project.

4.4.5 The Mining Act, 2012

There has been a clear lack of a formal mining policy in Kenya. Mineral exploitation and mining has been carried under the auspices of the Mining Act, Cap 306 (now the Mining and Minerals Act) administered by the Department of Mines and Geology in the Ministry of Mining. The Department has the responsibility of undertaking geological surveys, geo-scientific research, coordination

and regulation of the activities of the mining sector. All un-extracted minerals under or upon any land, as per the Act, are vested in the Government, subject to any rights, which under the Act, have been granted to any other person. The reviewed Mining and minerals Act law provides for lesser discretionary powers to the licensing authorities and hence provide for greater security of tenure. Similarly, there is now a planned mining policy, which will cover environmental protection, local processing, technology transfer and royalties and taxes. Kenyan laws now require that the resulting open pits be rehabilitated appropriately, so that the natural environment is protected.

The Mining and Minerals Act is the main legislative tool that governs the prospecting and extraction of all minerals including quarrying activities in the country. The Act vests all un-extracted minerals under or upon the land in the hand the government. Under the Act, it is an offence for any person to mine without authority. The Act lists areas or land where no person should mine unless with respective authority (Section 7). The proposed site is not near such areas. The Act provides for compensation by the miner for disturbance, nuisance or damage to lawful occupiers of the lands.

The proponent will ensure the stakeholders in the mineral sector are consulted before quarries are opened. EIAs will be carried for all quarries and borrow pits.

4.4.6 County Government Act, 2012

The main purpose of the enactment of this Act was to give effect to Chapter Eleven of the Constitution; to provide for county governments' powers, functions and responsibilities to deliver services and for connected purposes. Functions which were carried out by local governments were effectively transferred to the county governments.

The Act gives county the responsibility of planning and co-coordinating all developments within their areas of jurisdiction. Part XI (sections 102-115) of the Act provides for planning principles and responsibilities of the county governments. The land use and building plans provided for in the Act are binding on all public entities and private citizens operating within the particular county.

The proposed project is within the County of Busia and thus there will be need of working in liaison with the county government of Busia. The plans for the proposed project must be approved by the county government of Busia and the County government may also issue directives and authorizations on various aspects e.g. waste management and fire emergency preparedness among others.

Therefore, the proponent should work in liaison with County Government of Busia and in particular the department of Environment and Natural Resources.

4.4.7 Penal Code Act (Cap.63)

Section 191 of the penal code states that if any person or institution that voluntarily corrupts or foils water for public springs or reservoirs, rendering it less fit for its ordinary use is guilty of an offence. Section 192 of the same Act says a person who makes or vitiates the atmosphere in any place to make it noxious to health of persons /institution, dwelling or business premises in the neighborhood or those passing along public way, commit an offence.

The Proponent will be required to ensure strict adherence to the Environmental Management Plan throughout the project cycle in order to mitigate against any possible negative impacts

4.4.8 The Land Registration Act, 2012

The Land Registration Act is placed to revise, consolidate and rationalize the registration of titles to land, to give effect to the principles and objects of devolved government in land registration, and for connected purposes. This Act applies to Subject to section 4, this Act shall apply to:

- Registration of interests in all public land as declared by Article 62 of the Constitution;
- Registration of interests in all private land as declared by Article 64 of the Constitution;
- Registration and recording of community interests in land.

Section 24 states that: (a) the registration of a person as the proprietor of land shall vest in that person the absolute ownership of that land together with all rights and privileges belonging or appurtenant thereto; and (b) the registration of a person as the proprietor of a lease shall vest in that person the leasehold interest described in the lease, together with all implied and expressed rights and privileges belonging or appurtenant thereto and subject to all implied or expressed agreements, liabilities or incidents of the lease.

4.4.9 The Environment and Land Court Act, 2011

This Act is in place to give effect to Article 162(2) (b) of the Constitution; to establish a superior court to hear and determine disputes relating to the environment and the use and occupation of, and title to, land, and to make provision for its jurisdiction functions and powers, and for connected purposes.

4.4.10 The National Land Commission Act, 2012 (No. 5 of 2012)

Section 5 of the Act outlines the functions of the Commission, pursuant to Article 67(2) of the Constitution as follows 5(1):-

- a) To manage public land on behalf of the national and county governments;
- b) To recommend a national land policy to the national government;
- c) To advise the national government on a comprehensive programme for the registration of title in land throughout Kenya;
- d) To conduct research related to land and the use of natural resources, and make recommendations to appropriate authorities;

4.4.11 The Wildlife Conservation and Management Act, 2013

This Act may be cited as the Wildlife Conservation and Management Act, 2013. This Act shall apply to all wildlife resources on public, community and private land, and Kenya territorial waters. The primary purpose of this Act is to provide for the protection, conservation, sustainable use and management of wildlife in Kenya and for connected purposes ENACTED by the Parliament of Kenya, as follows—

- ➤ Part VI of the act section 1 clarifies the provisions of this Act with respect to conservation, protection and management of the environment shall be in conformity with the provisions of the Environmental Management and Coordination Act.
- Section 27 part (1) No user rights or other license or permit granted under this Act shall exempt a person from complying with any other written law concerning the conservation and protection of the environment.

4.4.12 The Energy Act of 2006

The Energy Act 2006 was enacted on 2nd January 2007. The Act establishes an Energy Regulatory Commission mandated to perform all function that pertains to energy production, transmission, setting and enforcing of energy policies, Public education and enforcing energy conservation strategies, prescribing the energy licensing process and issuing of licenses that pertain to energy sector in Kenya. Section 30 of the Act provides the factors that shall be taken into consideration prior to issuance of license. It states the need and expression of an entity to conserve and protect the environment and natural resources in accordance to the Environmental and Coordination Act of 1999 (No. 8 of 1999), moreover, the Act gives provisions for the need to protect health and safety of users of energy by providing an enabling environment of operation that protects the health and

safety of users of the service for which the license or permit is required and other members of the public affected by the undertaking.

4.5 Other key legislations in relation to this project include;

- a) Fisheries Policy, 2005;
- b) National Oceans and Fisheries Policy, 2008;
- c) National Aquaculture Policy, 2011;
- d) National Aquaculture Strategy and Development Plan, 2010 2015;
- e) The Fisheries Act CAP 378, revised, 2012;
- f) Fisheries (Safety of Fish, Fishery Products and Fish Feed) Regulations, 2019;
- g) Food and Agriculture Organization (FAO) Code of Conduct for Responsible Fisheries, 1995.

4.6 Relevant International Conventions and Treaties

Kenya is signatory to several international conventions and treaties that would need to be adhered to in implementing this project and are geared towards environmental protection and conservation. Some of these include;

- a) ILO Conventions ratified by Government of Kenya
- b) Safety and Health in Construction Recommendation, 1988
- c) Recruiting of Indigenous Workers Convention, 1936 (No.50)
- d) Convention on Wetlands or the Ramsar Convention
- e) The Convention on International Trade in Endangered Species (CITES)
- f) Convention on the Conservation of Migratory Species
- g) United Nations Framework Convention on Climate Change
- h) United Nations Convention to Combat Desertification
- i) United Nations Convention on Biological Diversity (UNCBD)

4.5.1 The Convention on Biological Diversity (1992)

The convention promotes the protection of ecosystems and natural habitats, respects the traditional lifestyles of indigenous communities, and promotes the sustainable use of resources. The project activities especially during construction will impact negatively to the flora and fauna of the respective construction areas. As such both the proponent and the contractor must ensure that the

activities of the proposed project do not affect the immediate ecosystems negatively and that the livelihoods of the local people are not negatively affected but rather enhanced.

4.5.2 Stockholm convention on Persistent Organic Pollutants (POPs)

POPs have a long time effect on the food chain and can persist in the environment for a very long time. Due to global warming, most of these pollutants end up in the Nordic countries and hence the convention was signed in Stockholm, Sweden. All states are to abide by requirements in the treaty as it is designed to protect human health and the environment from PoPs- which are chemical substances that are persistent and toxic, that bio-accumulate in fatty tissue (achieving higher concentrations as they move up a particular food chain) and that are prone to long range environmental transport. This convention is most pertinent during the construction phase of the project. The contractor and the proponent must ensure that the materials and processes employed do not lead to the emission of Persistent Organic Pollutants.

4.5.3 Vienna Convention for the Protection of Ozone Layer

Inter-governmental negotiations for an international agreement to phase out ozone depleting substances concluded in March 1985 with the adoption of this convention to encourage intergovernmental co-operation on research, systematic observation of the ozone layer, monitoring of CFC production and the exchange of information. Therefore both the proponent and the contractor are obliged to minimize or phase out the generation of CFCs into the atmosphere during both phases of project implementation.

CHAPTER FIVE: PUBLIC PARTICIPATION

5.1 Introduction

This chapter describes the process of the public consultation that was followed to identify the key issues and impacts of the proposed development. Views from the general public and neighbors, who in one way or the other would be affected by the proposed project, were sought through oral interviews and administering of questionnaires as stipulated in the Environment Management and Coordination Act, CAP 387. A number of site visits has been made to the site to interview the residents.

One of the key information sources used during the Environmental and social Impact Assessment exercise was public participation exercise. The exercise was conducted by a team of experienced registered environmental experts via administration of pre- designed questionnaires and by interviewing neighbors surrounding the proposed project site.

The purpose for such interviews was to identify the positive and negative impacts and subsequently promote and mitigate them respectively. It also helped in identifying any other issues which may bring conflicts incase project implementation proceeds as planned.

5.2 Objectives of the Consultation and Public Participation (CPP)

The objective of the consultation and public participation was to;

- a) Disseminate and inform the stakeholders about the project with special reference to its key components and location.
- b) Gather comments, suggestions and concerns of the interested and affected parties
- c) Incorporate the information collected in the ESIA study.
- d) Increasing public confidence
- e) Improving transparency and accountability in decision making
- f) Reducing conflict that may arise

In addition, the process enabled,

- The establishment of a communication channel between the general public, the team of consultants and the project proponent
- 2) The concerns of the stakeholders to be known to the decision-making bodies at an early phase of project development.

5.3 Methodology used in the CPP

The Consultation and Public Participation (CPP) Process is a policy requirement by the Government of Kenya and a mandatory procedure as stipulated by EMCA CAP 387, section 58, on Environmental Impact Assessment for the purpose of achieving the fundamental principles of sustainable development.

In general, the following Steps were followed in carrying out the entire CPP process:-

- a) Identification of individuals interested in the process-database of the interested and affected parties
- b) Administration of questionnaires to the different target groups and local community members along the proposed project Site

Administration of Public Participation Questionnaires

During the third and fourth week of the month of May, 2019, a site visit was made to the site and a number of questionnaires were administered to the public and the residents. The copies of the questionnaires were attached to the proposed report and submitted to NEMA for approval.

In the fourth week of May, a total of eighty (80) questionnaires were administered at the proposed site and its environs. The questionnaires were administered to an area of a radius of about 1km from the site. The target group for this area were the residents in close proximity to the proposed project.

Plate 6: Consultation and Public participation meeting held in Bukani Village

5.4 Issues Raised during Public Consultation

5.4.1 Positive Issues

- The project will enhance efficiency in water supply
- The project will enhance economic activities mainly farming and thus improving livelihood
- The project will create employment opportunities
- There will be time saving since residents will not have to keep walking for long distances in search of water
- The project will ensure supply of water throughout the year regardless of the season
- Availability of water will enhance agriculture especially in livestock development
- Construction will bring other infrastructural development in the area among them the road leading to the pan site and water related facilities.
- Reduction in poverty levels of many households. This will be as a result of the availability of more farm outputs that can be sold in the available markets.
- Diversification of farming enterprise leading to improved nutrition as a result of availability of water and development of fish ponds for fish farming
- Lower food prices making food affordable in most homesteads due to livelihood diversification
- There is the likelihood of improved agricultural extension services within the project area.

5.4.2 Negative Issues

- May lead to environmental degradation and destruction of farm structures and crops in case
 of pan burst and leakages
- Destruction of indigenous vegetation due to the clearance of vegetation to create room for more fish ponds
- Increased incidences of diseases especially malaria due to many fish ponds that create good habitat for mosquitoes
- If the pan is not well secured it can be a source of safety risk for the community and animals
- Noise during construction of the pan
- Removal of vegetation cover/ Destruction of vegetation cover
- Aquatic life may be affected downstream

6.1 Introduction

This section identifies the potential social and environmental impacts of the proposed projects in terms of the nature, magnitude, extent and location, timing and duration of the anticipated impacts. These impacts may relate to the project design stage, construction stage or the project operation and decommissioning stage. Based on impact prediction methods, site visits and observations and the results of public consultations, both beneficial and adverse environmental impacts have been identified. Suitable mitigation measures to the negative impacts are discussed in chapter 7. These are then costed and responsibilities for their implementation assigned as appropriate within the Environmental and Social Management Plan (ESMP). Both potential negative and positive impacts have been considered during the siting and Construction phase, Operational Phase and Decommissioning phase.

6.2 Siting and Construction Phase

During the sitting and construction of both the pan and aquaculture, there is a likelihood of having the following impacts.

6.2.1 Positive Impacts

6.2.1.1 Employment opportunities

There will be job opportunities especially to casual workers/ community members. Employment opportunities are a benefit both in economic and social sense. In the economic sense it means abundant unskilled labour will be used in economic production. In the social sense these young and energetic otherwise poor people will be engaged in productive employment other than remaining idle. Remaining idle may attract them into social ills like drug abuse and other criminal activities like robberies. Several community members are expected to work on the site for a period that the project will start to the end.

The proposed two projects of pan and fish ponds construction, will directly employ a minimum of the following groups;

- Community members
- Supervising engineering team for the pan;
- Contractor's staff (managerial, skilled and unskilled labour force);
- Suppliers of plant, machinery, materials and essential services;

• Construction monitoring personnel from the county Government and other lead agencies such as NEMA & KFS.

6.2.1.2 Provision of Market for Supply of Building Materials

The project will require supply of project materials some, of which will be sourced locally in the surrounding areas such as sand, Ballast, stones and murram for office construction, fence and Pan bank stabilization.

6.2.1.3 Increased Business Opportunities

The number of project staff especially the community members and other related staff required will provide ready market for various goods and services, leading to business opportunities for small-scale traders such as food vendors around the project site.

6.2.1.4 Increased revenue to suppliers of construction materials and utilities

This will be an opportunity for the suppliers of construction materials especially for pan bank stabilization to create market and sell their goods. In turn this will boost their profit margin which is an advantage to their businesses.

6.2.1.5 Increased production

The community will be able to put into productive use their currently idle lands. Increase in the amount of water from the constructed dam will result to increased area under farming and in the long run increased produce. Besides increasing the community's food security status, the increased production can also result in surplus produce, which can be sold in other areas within the County thus being a source of income for the individual households.

6.2.2 Potential Negative Impacts for Pan and Aquaculture Development

The key negative impacts identified during the construction phase for both the pan and the Aquaculture include;

6.2.2.1 Soil Erosion

Stripping of the vegetation will expose the top soil to agents of erosion and the movement of vehicles and machinery in the area may aggravate the problem. Soil erosion is an important problem both at its source and downstream of the development site. Lost soil will be deposited somewhere, and the location of the deposition could alter downstream hydrology and increase flooding. It may also pose a water quality issue directly as a result of siltation and indirectly from

contaminants carried with or attached to soil particles and it may also negatively affect the soil fertility of the affected land.

6.2.2.2 Waste generation (solid wastes)

The project is expected to generate solid wastes. Wastes can be injurious to the environment through blockage of drainage systems, choking of water bodies and negative impacts on animal health as they can be potential breeding grounds for disease causing pathogens. Some of these waste materials especially the plastics and polythene bags are not biodegradable hence may cause long-term injurious effects to the environment. This assessment takes care of solid wastes from the construction activities and from the operation activities. During the construction phase, the leftovers of the construction materials will be the main source of solid wastes. These will include soil, broken blocks, sand, empty cement bags, broken pipes, and empty paint containers among others.

6.2.2.4 Habitat Degradation

The destruction of habitats for the establishment of aquaculture farms and pan will be negative if the habitat is considered ecologically or economically important. Such areas would include breeding, nesting, nursery and foraging areas for a range of species with emphasis on rare and endangered species and species of conservation importance.

The construction of ponds, pan, office store and associated infrastructure will require rudimentary earthworks. These earthworks and the clearing of vegetation may lead to erosion and the smothering of habitat through the associated deposition.

Poor environmental management at both pond and pan could result in the pollution of receiving water resources. This could negatively affect the health of indigenous aquatic species.

Plate 7: Vegetation likely to be affected by the project

6.2.2.5 Risk of Leaks and Spills

Oil and other lubricants can lead to leaks and spills from the machinery used in the project site. This are likely to cause more harm to the surrounding environment and related biodiversity.

6.2.2.6 Air Quality

Emissions in forms of dust, particulate matter, fugitive emission and, exhaustion from project machines and equipment are anticipated during the project construction phases particularly for the Pan. These emissions emanating from trucks and construction equipment are known to have adverse impact on the environment, plant and human health including effect on the upper to lower respiratory infections and silicosis condition.

- ✓ Activities likely to generate dust include speeding of vehicles on earth surface not palliated with water, excavation of earth materials in dry sections;
- ✓ Activities likely to generate particulate matter include loose material transportation, vehicle and machines exhaust emissions
- ✓ Some of the particulate matter to be generated include sand, soot, gravel and murram, among others; and

✓ Exhaust emissions likely to be generated include smoke, hydrocarbons and nitrogenous gases among others pollutants from vehicles, machinery and equipment's exhausts.

6.2.2.7 Occupational Health and Safety Issues

Potential impacts during construction include: exposure to physical hazards from the use of equipment's; trips and fall hazards and exposure to dust and noise. Other injuries or fatalities may result from workers operating equipment without adequate training or with lack of PPE or extended exposure to outdoor weather.

6.2.2.8 Excessive Noise and Vibration

Levels of noise and vibrations typical of construction works will be generated at the project site during the construction phase. This noise impact is expected to be negative in the long and short-term. The major sources of noises and vibration will be construction equipment's, vehicles and workers.

Elevated noise and vibration levels within the site are adverse to the health and safety of the project workers, the residents, passers-by and, other persons and animal within the vicinity of the project site. The major receptors exposed to the noise are expected to be at a minimum and will include mainly the construction workers.

6.2.2.9 HIV/AIDS

The project will attract new people to the project area and increase the amount of disposable cash of the construction workers. This may lead to several repercussions leading to the spread of HIV/AIDS and/or other sexually transmitted diseases (STDs). Influx of new people to the project area especially construction workers can affect the number of new cases of HIV, because they often interfere with an otherwise stable situation but the contrary can also happen where the newcomers find themselves at higher risk.

6.2.2.10 Surface and Ground Water Hydrology and Water Quality Degradation

Changes in surface hydrology alter the flow of water through the landscape. Project related excavation could lead to surface and ground water quality degradation. Contaminated soil or ground water in the path of the project could be disturbed by excavation resulting in a potential transfer of the contamination to surface waters. The excavated area, if linear could act as a conduit to extend groundwater contamination to new areas. Spills of hazardous materials in excavated areas could introduce contaminants to ground water.

6.2.3.11 Increased Storm Water Volume

There is a likelihood of interference with the percolation and flow of storm water from the excavations.

6.3 Operational Phase

Some of the impacts both positive and negative that may be as a result of the proposed projects during the operation stage will include;

6.3.1 Positive Impacts

It is anticipated that the operations phase of this project will result in the following positive impacts;

- Optimal use of land especially for both the Pan and Aquaculture
- Increased agricultural productivity
- Increased food production
- Improved livelihood of the community as a result of fish farming
- Increased business opportunities for agricultural goods
- Increased Community resilience to Climate Change
- Flood control in some of the farms due to the constructed dyke

6.3.2 Negative Impacts

The potential impacts likely to occur during the operations and maintenance phase of the projects include;

6.3.2.1 Occupational Health and Safety Issues

Occupation health and safety hazards during the operation and maintenance phases shall result from various sources and have adverse effects if not controlled within recommended limits. Some of the risk sources are use of water that has been contaminated and drowning of humans and animals

6.3.2.2 Risks to Indigenous Fish Species

The exotic Nile tilapia is currently farmed and widely distributed within Kenya, and as such the risk of hybridization already exists. The transportation of fingerlings will increase the chance of diseases being spread. Hormones and treatments used in the production of fish may also influence indigenous fish communities if exposed.

6.3.2.3 Gender mainstreaming

Gender based violence may arise during project construction and operation phase due to allocation of job opportunities.

6.3.2.4 Insect vectors

Mosquitoes breed in standing waters which are likely to happen at the aquaculture, dykes and the water pan and this is likely to increase the incidences of Malaria disease in the community.

6.3.2.5: Fish Diseases

Fish disease spread and infestation due to poor aquaculture management strategies. Intensive aquaculture is known to result in a spike in disease due to the movement of fish to new areas and their stocking in high densities. Transportation stresses fish and lowers their immune systems making them more susceptible to disease. Diseases bring risks to production and market access due to fish deaths and public health risks. For example, *Streptococcus* bacteria in tilapia populations can potentially affect humans.

6.3.2.6: Water pollution

This may occur due to aquaculture waste (e.g. faeces and feed) and the use of chemicals, it is typically rich in carbon, nitrogen and phosphorous. The quality of water used in aquaculture directly affects feed efficiency, growth rates and health. Most fish fatalities, disease outbreaks, slow growth, poor feed conversion efficiency and similar management problems are directly correlated with poor water quality.

Organic enrichment mainly produced by overfeeding and over fertilization can result in the eutrophication of water especially in systems that are not filtered or flushed regularly.

6.3.2.7: High Water Demand

Aquaculture requires a reliable freshwater source and there will be high demand for water during the dry spell hence putting more pressure on the constructed water pan which will be the only source of water for the aquaculture and the domestic use by the surrounding community. If freshwater flow is reduced there is an increase in the risk of disease outbreaks and water conflicts downstream.

6.3.2.8: Predators

Various predatory animals are attracted to aquaculture production facilities as the high concentration of prey items could lessen the effort of obtaining a meal.

6.4 Decommissioning Phase

Some of the anticipated impacts during the decommissioning phase of the proposed projects include;

6.4.1 Positive Impacts

In the event that the project will be decommissioned, the primary activity is expected to be rehabilitation of the site.

The potential positive impacts during the decommissioning phase include;

- Rehabilitation and restoration of the site to its original status
- Employment opportunities

6.4.2 Negative Impacts

The following are the potential negative impacts;

6.4.2.1 Noise Pollution

Activities likely to produce noise during decommissioning include cutting and demolition of structures, machine operations used in pan and office construction.

6.4.2.2 Air/Dust Pollution

This is expected to result from demolishing of structures at the site and the transport of demolition debris to the disposal site especially for the pan

6.4.2.3 Vegetation Disturbance

Vegetation disturbance is likely to happen as a result of decommissioning

7.1 Introduction

The proponent of the proposed project acknowledges the fact that the proposed project activities will have some impacts on the biophysical environment, health and safety of its employees and members of the public, and socio economic wellbeing of the local residents. Thus, the main focus will be on reducing the negative impacts and maximizing the positive impacts associated with the project activities through a programme of continuous improvement.

An environmental and social management/monitoring plan will be developed to assist the proponent in mitigating and managing impacts associated with the life cycle of the projects.

7.2 Proposed mitigation measures

7.2.1 Construction and Operational Phase

7.2.1.1 Soil Erosion

Site clearing or disturbance of the natural vegetation will be planned and approved as part of project management process.

Areas cleared, excavated, or/and exposed during construction will be re-vegetated using native vegetation species, preferably of species growing in the immediate pristine environment to allow harmony with the surrounding and minimize duration for watering and care. The restoration period will require monitoring of the re- vegetated sites to assess impacts of heavy foraging, patch growth as well as gulley formation. Presence of well rooted vegetation will act as soil stabilization for the areas.

7.2.1.2 Gender mainstreaming

Gender based violence may arise during project construction and operation phase due to allocation of job opportunities.

Mitigation measure

•Mainstream gender inclusivity in hiring of workers and entire project management as required by gender policies and gender rules

7.2.1.3 Waste generation (Solid and liquid)

1) Mitigation Measures for Solid Waste Management

A site waste management plan should be prepared by the contractor prior to commencement of construction/installation activities. This should include designation of appropriate waste storage areas, collection and removal schedule, identification of approved disposal site, and a system for supervision and monitoring.

- Special attention should be given to minimizing and reducing the quantities of solid waste produced during site preparation and construction.
- Any vegetation and combustible waste should not be burned on the site.
- Reusable inorganic waste (e.g. excavated sand/soils) should be stockpiled away from drainage features and used for in filling where necessary and/or possible.
- Unusable construction/ installation waste, such as damaged pipes, formwork and other construction material, must be disposed of at an approved dumpsite.
- Provide solid waste receptacles and storage containers, particularly for the disposal of plastic bags, boxes, so as not to block drainage system and to prevent littering of the site.
- Make arrangements for the daily collection of litter from the site and appoint a licensed solid waste transporter to collect and transport it for dumping at approved site.

2) Mitigation Measures for Liquid Waste management:

- Provide workers with appropriate sanitary facility which can be in the form of exhaustible mobile toilets
- Alternatively effluent from mobile toilets should be disposed by a registered NEMA wastewater handler
- A specific area for washing of cement trucks and equipment's should be identified and should not be near in water bodies
- ➤ All equipment must be fuelled at properly designed fuelling stations.

7.2.1.4 Habitat Degradation

- Map out ecologically sensitive areas at the site and make them known to the engineers and contractor
- ➤ Ensure there is selective clearing of the vegetation this allows future re- growth and regeneration. This will ensure minimal disruption of wild fauna's natural movement, territoriality, and other ecological processes;

➤ It is desirable to re-vegetate disturbed areas along roads, and pavements and other construction sites.

7.2.1.5 Air quality

The following mitigation measures are recommended to control effects of project on air quality and human health:

- Provide personnel with Personal Protective Equipment & Clothing (PPE&C) such as dust masks, boots among others. Mechanism should be put in place to ensure PPE&C are specific for the activities at hand and are always worn within the project sites
- The stockpiles of earth generated during construction works, unpaved access roads and areas used for handling fine construction materials should be palliated with water regularly in order to suppressed evolution of particles
- All machinery and equipment should be maintained in good working condition in order to minimize emissions to acceptable standards
- Train construction and delivery trucks drivers on pre-cautionary measures that enable curb
 emissions for example advise on techniques to reduce dust evolution especially when
 nearing the project site to avoid creating dusty conditions; techniques to conserve fuel and
 reduce emission by switching off the engines when vehicles are idling
- Construction trucks delivering materials to site should be covered in order to minimize spread of fugitive emissions to the surrounding areas
- No burning of materials should be permitted at the project site
- Use clean energy to fuel project vehicles, equipment's and machines in order to reduce air pollutants

7.2.1.6 Risk of Leaks and Spills

The following mitigation measures are recommended to control effects of project on risk of leaks and spills:

- Conduct regular maintenance of site equipment and machinery to ensure leakages are controlled or detected early;
- Project vehicles and equipment should be serviced according to manufacturer's requirements to limit release of exhaust emissions
- Investigate the possibility of fitting catalytic converters in machines with engines so as to convert harmful substance in the exhaust fumes to less harmful substances

- ➤ Safety procedures for fuel storage and re-fuelling should be well understood and implemented by site staff; and oil residuals including waste oil, lubricants, used filters, should be carefully collected and stored for safe disposal, in order to prevent spillover effects of contaminant hydrocarbons into storm water or groundwater resources
- Protect project area from fire by posting warning signs in area where hydrocarbon fuels are used
- Observe the requirements of the emission control regulations.

7.2.1.7 Occupational Health and Safety Issues

- Ensure all equipment's are inspected before use for appropriate safe guards and that the machine operators are trained on machine safety
- Caution will have to be kept at high and strict consideration during any excavation works and work at height
- Ensure the working hours are controlled and that employees are not allowed to extend the working hours beyond an acceptable limit for purposes of gaining extra pay
- Ensure appropriate road safety signage's are strategically placed and drivers adhere to the requirements of such signage
- Comply with the provisions of the OSHA 2007 and its subsidiary legislation.

7.2.1.8 Excessive Noise and Vibrations

The following mitigation measures are recommended to control effects of noise and vibrations during construction phase:

- Conduct periodic noise measuring and monitoring to determine levels and extent of harmful noise
- Clearly label the high noise areas
- Provide PPE (hearing protection) to persons operating within or visit identified high noise areas
- In order to meet noise level requirements, the works equipment's should be equipped with standard noise attenuation features. Machines that exceed acceptable noise limits should be equipped with silencers or lagging materials or specially designed acoustic enclosures
- Inform local residents when construction activities are likely to generate excessive noise in order to minimize disruption to local residents

Sensitize truck drivers to switch off engines while offloading materials; to avoid gunning vehicle engines or hooting especially when passing through sensitive areas such as churches, residential areas and hospitals.

7.2.1.9 HIV/AIDS

Measures recommended for implementation to enable reduce the spread of the virus include the following;

- a) Review the construction activities to integrate with the HIV/AIDS campaigns
- b) Develop appropriate training and awareness materials for Information, Education and Communication (IEC) on HIV/AIDS
- c) Identify other players (local CBOs, NGOs, and government organizations) on HIV/AIDS for enhanced collaboration
- d) Develop an intervention strategy compatible with the construction programme to address success of the HIV/AIDS prevention and provide peer educators for sustainability in collaboration with other stakeholders
- e) Integrate monitoring of HIV/AIDS preventive activities as part of the construction supervision. Basic knowledge, attitude and practices are among the parameters to be monitored, and particularly on provision of condoms, status testing and use of ARVs.

7.2.1.10 Hydrology and Water Quality Degradation

Several measures shall be put in place to mitigate the impacts that are likely to lead to hydrology and water quality degradation. The proponent will prepare a hazardous substance control and emergency response plan that will include preparations for quick and safe cleanup of accidental spills. It will prescribe hazardous-materials handling procedures to reduce the potential for a spill during project operation, and will include an emergency response programme to ensure quick and safe cleanup of accidental spills. The plan will identify areas where refueling and vehicle maintenance activities and storage of hazardous materials, if any, will be permitted.

Soil sampling and trial holes digging will be conducted before excavation for foundations begins and soil information will be provided to excavation crews to inform them about soil conditions and potential hazards. If suspected contaminated groundwater is encountered in the depths of the proposed development, samples will be collected and submitted for laboratory analysis for petroleum hydrocarbons, metals, volatile organic compounds and semi-volatile organic compounds.

7.2.1.11 Fish Diseases and mortality

Mitigation measures include;

- ✓ Practice good fish pond husbandry;
- ✓ Limit the use of chemicals;
- ✓ Farmers must maintain suitable environmental conditions, select healthy fish, provide a nutritious diet, limit stress and vaccinate

7.2.1.12 Risks to indigenous fish species

A risk assessment should be conducted prior to the introduction of new chemicals.

7.2.1.13 Water pollution

Establish a comprehensive water quality monitoring programme that includes the following:

✓ Monitoring of dissolved oxygen, temperature, pH, turbidity, nutrients, total P, chlorophyll, algal cell counts and identification, and whatever else is required for good management of fish health and water quality;

7.2.1.14 Predator related fatalities

Mitigation measures include;

- ✓ Sunlight resistant cover netting on aquaculture facilities should be used for keeping predatory birds out; and, for providing shade over the production activities. This netting must be erected and maintained in a manner that does not pose a threat to any birds and other animals.
- ✓ Shade cloth or bird netting must be of such a mesh size, structure and of rigid material so that entrapment or injury of any birds (and other animals) is prevented;
- ✓ Netting must be ultra violet (UV) and weather resistant to prevent it from tearing and becoming tattered;
- ✓ Netting must be firmly secured to prevent it from tearing in windy conditions; and
- ✓ Although the colour of such netting must be neutral, it must also be clearly visible by birds approaching the facility.

7.2.1.15 Fish feed Waste and related problems

- Uneaten feed accumulates as waste and produces ammonia as it decomposes in the Pond hence causing pollution
- Uneaten feed accumulating at the bottom of the ponds where it is synthesized and sinks to the bottom to be mineralized by bacteria. Theses feeds contains some macro-minerals which are possible pollutants of the environment
- Waste can accumulate beneath ponds and cause deterioration of water quality, which can have a negative impact on the fish in the ponds.

Mitigation measures include;

- ✓ Feed on response to avoid overfeeding
- ✓ Practice regular flushing of ponds
- ✓ Monitor feed for macro-minerals like phosphorus and nitrogen
- ✓ Increase feed use efficiency by using high-quality feed that contains desired nitrogen and phosphorus minerals and by ensuring that fish consume most of the feed offered
- ✓ Apply appropriate feed type and size suitable for a specific stage of fish

7.2.1.16 Pond effluent

Increase in accumulation of waste in the lake hence affecting the bottom dwelling organisms

- Organic anions may become a part of the total alkalinity in polluted waters.

Mitigation measures include;

✓ Ensure that the inlet and discharge points are independent from each other so as to guarantee that water supply and effluent do not mix

7.2.2 Decommissioning Phase

7.2.2.1 Noise Pollution

Mitigation measures include:

1. Schedule noisy activities during the day time period

- 2. Use silencers on machines where possible
- 3. Ensure machinery is well maintained to reduce noise emitted.

7.2.2.2 Air/dust Pollution

Mitigation measures include;

- Practice dust management techniques, including watering down dust
- Set up dust barriers/ screens at strategic locations
- Provide and enforce the appropriate use of Personal Protective Equipment (PPE) against dust.

7.2.2.3 Solid waste

Mitigation measures include:

- > Disposal of solid waste in compliance with EMCA 2006 waste management regulations
- Segregation of waste to encourage reuse and recycling;

7.2.2.4 Liquid waste

These are likely to arise from cleaning activities and sanitary facilities.

Mitigation measures include:

- Prudent use of water to reduce liquid waste volumes
- Adhere to EMCA 2006 water quality regulations
- Adhere to WRMA 2007 guidelines for effluent discharge into surface water resources

7.2.2.5 Occupational Health and Safety Hazards

Mitigation measures include:

- The Contractor should ensure registration of all workplaces by the Director, Directorate of Occupational Health and Safety (DOHSS) forming the basis of work statistics
- > The Contractor should ensure provision of appropriate Personal Protective Equipment (PPE) for staff such as:
 - ✓ Earmuffs for ear protection
 - ✓ Helmets for head protection
 - ✓ Dust masks for dust protection for all project works
 - ✓ Goggles with good visibility for eye protection
 - ✓ Overalls and dust coats to protect the skin

- ✓ High-visibility retro-reflective fluorescent yellow-green, fluorescent orange/fluorescent red jackets with 360o visibility
- ✓ Safety Shoes for protection of the feet
- ✓ Gloves of different types according to specific works
- ➤ The Project Manager should ensure that the contractor complies with all standard and legally required health and safety regulations as set out by the Occupational Safety and Health Act (Part XI: Section 96) as pertains to construction activities

DECOMMISSIONING ESMP

Note: A due diligence environmental audit will be undertaken and submitted to NEMA at least three months prior to decommissioning and in line with the Environmental Management and Coordination Act CAP, 387 Laws of Kenya.

CHAPTER EIGHT: ANALYSIS OF PROJECTS ALTERNATIVES

This section analyses the project alternatives in terms of site, materials and technology scale, solid waste, wastewater management and irrigation Technology options and shall involve studying design alternatives and analyzing them based on the environmental costs and benefits.

8.1 Relocation Option

Relocation option to a different site is an option available for the project implementation but as per now, the proponent does not have an alternative site.

8.2 No Project Alternative

The No Project option in respect to the proposed projects implies that the status quo is maintained. This option is the most suitable alternative from an extreme environmental and social perspective as it ensures non-interference with the existing conditions. This option will however, involve several losses both to the proponent and the community as a whole. The land will continue to remain idle and underutilized.

8.3 The proposed development alternative

Under the proposed development alternative, the proponent of the proposed projects would be issued with an ESIA License. In issuing the license, NEMA would approve the proposed projects, provided all environmental and social measures are complied with during the planning, construction and operational phases.

8.4 Drilling a Borehole

Drilling of a borehole could be an alternative to the proposed pan project. But, as it is widely known, it is very hard to drill a borehole that can yield water adequate enough for a population of about 6,000 people. It is also known that boreholes dry up after sometime and that their water is not assured to be soft. Drilling of boreholes is also associated with drying of lands due to their effect on underground water levels; unlike surface water resources such as the proposed water pan that lead to high levels of underground water as well as leading to creation of conducive micro-climates around them. Hence, drilling of a borehole is a not viable alternative to the proposed water pan.

8.5 Analysis of Alternative Construction Materials and Technology

The proposed project will be constructed using locally, modern and internationally accepted materials to achieve public health, safety, security, social and environmental aesthetic

requirements. Equipment that saves energy and water will be given first priority without compromising on cost or availability factors. The pan banks will be constructed using stones, granular soils, clay, sand and cement among other ecologically friendly materials.

8.6 Solid waste management alternatives

A lot of solid wastes will be generated from the proposed development. An integrated solid waste management system is recommendable. First, the proponent will give priority to Reduction at Source of the waste materials. This option will demand a solid waste management awareness programme in the management and the workers. Notices for proper waste management/handling may be posted at strategic places for the sake of visitors.

CHAPTER NINE: ENVIRONMENTAL AND SOCIAL IMPACTS MANAGEMENT AND MONITORING PLANS

9.0 Introduction

The proponent of the proposed projects acknowledges the fact that the proposed projects activities will have some impacts on the biophysical environment, health and safety of its employees and members of the public and socio-economic wellbeing of the local residents. Thus, the main focus will be on reducing the negative impacts and maximizing the positive impacts associated with the projects activities through a programme of continuous improvement. An Environmental and Social Management/Monitoring Plans have been developed to assist the proponent in mitigating and managing environmental and social impacts associated with the life cycle of the projects. The ESIMP has been developed to provide a basis for an Environmental Management System (EMS; ISO 14001 principles) for the project. It is noteworthy that key factors and processes may change through the life of the projects and considerable provisions have been made for dynamism and flexibility of the ESIMP. As such, the ESIMP will be subject to a regular regime of periodic review.

Table 7: Environmental and Social Management Plan for the Pan

Potential Environmental/ Social impacts		Recommended Mitigation measures	Responsible Party		Time frame	Cost (K.shs)		
		1. Curb project associated conflicts and Lost Time Injuries (LTI)e.g. Disputes with neighborhood						
Project Implementation Disputes		Community agreements and negotiations should be formalized before the project start as per the laws of the land	Proponent/County government of Busia and community members		Project Planning Phase			
		Sufficient planning for adequate resources required i.e. financial, personnel and equipment	Proponent &Contractor		Project Planning Phase			
	2. Pan Safety-General and due to failure of Pan or overflow							
		The spill way is designed to safely discharge	Contractor/County		Throughout

CERTIFICATION.

We do hereby submit the Environmental and Social Impact Assessment project Report for the proposed construction of Bukani water pan and Development of aquaculture in Buloma Sub – location, Namboboto Location, Namboboto //Nambuku Division, Samia Sub-county, Busia County. To our knowledge all information contained in this report is accurate and a truthful representation of all findings as relating to the proposed project as per project description by the proponent.

ACKNOWLEDGEMENT

The assessment team wishes to thank the proponent and the entire Community of Buloma at large for the cooperation and assistance accorded to the ESIA consultancy team during the field visits and public participation in provision of relevant pertinent data /or information and documents for the proposed project.

EXECUTIVE SUMMARY

1.0 Introduction

Kenya's economy is largely rural-based and heavily dependent on its natural resource base. Water resources usually play a key role in the economy for all sectors including urban and rural consumption, fishery development, agricultural, livestock and tourism development. Kenya is classified by the U.N. as a chronically water-scarce Country. The Country's natural endowment of freshwater is highly limited, with an annual renewable freshwater supply of about 647 cubic meters per capita, significantly below the 1,000m3 capita set as the marker for water scarcity. Despite this, the UN Sustainable Development Goal Six (SDG-6) aims at ensuring access to safe and affordable water for all by year 2030. This is in line with Article 43 of the National Constitution of Kenya which provides for the access to clean and safe water for all. Similarly, one of the flagship activities for Kenya Vision 2030 is aimed at achieving universal access in water and sanitation services by 2030. All these targets call for equitable sharing of scarce water resources among the 47 counties in the country. In addition to goal 6, Goal 1 calls for ending extreme Poverty in all forms and Goal 2 calls for ending hunger, achieve food Security and improve nutrition and Promote Sustainable Agriculture.

In line to the above sustainable development goals, the Kenya Climate Smart Agriculture is a project being implemented in Busia County under the Department of Agriculture and animal Resources and funded by the World Bank. The project entails construction of Bukani water pan of 17,000m² with a capacity of 26,000m³ and development of 130 fish ponds in Buloma Sublocation, Namboboto Nambuku ward, Samia Sub-County, Busia County and is expected to benefit more than 6,000. The project's specific objectives include;

- vii. To Build the community resilience to Climate Change
- viii. To Increase fish production
- ix. To Increase food security
- x. To increase income for the community members

- xi. To Provide water for the community for various uses
- xii. To improve the living standards of the community

The Kenya Government policy on projects of such nature and scale, programmes or activities requires that an Environmental and Social Impact Assessment study be undertaken/ report be prepared at the planning stages of the proposed undertaking to ensure that significant impacts on the community and environment are taken into consideration during the design, construction, operation and decommissioning of such projects, programmes or activities.

Therefore, in compliance with the law and to avoid unnecessary conflicts that may retard development in the county, the proponent undertook this Environmental Impact Assessment and incorporated environmental and social concerns as required by EMCA CAP 387 Laws of Kenya.

2.0 Scope, Objective and Criteria of the Environmental and Social Impact Assessment Study.

The Kenya Government policy on all new projects, programmes or activities requires that an Environmental and social Impact Assessment (EIA) is carried out at the planning stages of the proposed project to ensure that significant impacts on the environment are taken into consideration during the design, construction, operation and decommissioning of the proposed development. The scope of this project, therefore, covered:

- i. The baseline environmental conditions of the area,
- ii. Description of the proposed project,
- iii. Provisions of the relevant environmental laws,
- iv. Identification and discuss of any adverse impacts to the environment and the community anticipated from the proposed project,
- v. Appropriate mitigation measures,
- vi. Provision of an Environmental Management Plan (EMP) outline.

The overall objective of the project is to ensure that all environmental and social concerns are integrated in all the development activities in order to contribute to the sustainable development. Specifically the objectives are:

- i. To identify potential environmental impacts, both direct and in direct
- ii. To assess the significance of the impacts
- iii. To propose preventive mitigating and compensative measures for the significant negative impacts of the project on the environment
- iv. To generate baseline data for monitoring and evaluation of how well the mitigating measures are being implemented during the project cycle.
- v. To present information on impact of alternative
- vi. To present the results of the ESIA that can guide informed decision making
- vii. To prepare EMP for the proposed project and decommissioning plan.

3.0 Terms of Reference (TORs)

The consultant incorporated the following terms of reference but not limited to;

- a) Location of the proposed project
- b) A concise description of the national environmental legislative and regulatory framework, baseline information and any other relevant information related to the project.
- c) The objectives of the project.
- d) The technology, procedures and processes to be used, in the implementation of the project.
- e) The materials to be used in the construction of the project.
- f) The products, by-products and waste to be generated by the project.
- g) A description of the potentially affected environment and the society
- h) The environmental effects of the project including the social and cultural effects and the direct, indirect, cumulative, irreversible, short-term and long-term effects anticipated.
- Analysis of alternatives including project site, design and technologies.
- j) An environmental management plan proposing the measures for eliminating, minimizing or mitigating adverse impacts on the environment.

- k) Provide an action plan for the prevention and management of the foreseeable accidents and hazardous activities in the course of the project implementation.
- I) Propose measures to prevent health hazards and to ensure a secure and habitable working environment for the project staff.

4.0 Methodology

The methodology used in the study consisted of the following:

- i. Environment screening, in which the project was identified as among those requiring environmental impact assessment under schedule 2 of EMCA, CAP 387 laws of Kenya.
- ii. A site reconnaissance and visual survey to determine the baseline information of the project area
- iii. Analysis of the project documents
- iv. Discussion with the proponent, the community and the entire Project Team
- v. Assessment of the site to detail the various existing and likely impacts.
- vi. Assessment of health and safety issues
- vii. Seeking public views through interviews, public meeting (baraza) and questionnaires.
- viii. Proposal of mitigation measures to minimize any anticipated negative impacts.
- ix. Preparation and submission of the ESIA report

5.0 Environmental Impacts

a) Positive impacts

- Employment opportunities
- Increased local incomes
- > Economic growth
- Increased fish production
- Improved water supply
- Reduction in water fetching time
- ➤ Habitat support for migrant birds
- Water bird breeding
- > Agricultural support

b) Negative impacts

The potential negative environmental and social impacts of the proposed project and possible mitigation measures are summarized below;

Impact	Proposed Mitigation Measure
Project Implementation Disputes	 Community agreements and negotiations should be formalized before the project start as per the laws of the land Sufficient planning for adequate resources required i.e. financial, personnel and equipment
Noise and vibration	 Formulate an inspection and maintenance Program for the machines and equipment onsite. Implement both engineering and administrative controls for machines and equipment to reduce noise pollution at the site.
Catchment erosion and reservoir siltation and long-term nutrient build-up and reservoir eutrophication Air Pollution: Dust generation.	 The Proponent in collaboration with other partners should undertake education and awareness on proper land use practices around the Pan catchment areas. Sprinkling of water at the site and access roads during dry conditions to suppress fugitive dust
Solid waste	 Integrated Solid Waste Management to be encouraged Adhere to the provisions of the Waste Management Regulations of 2006
Fish feed waste	 Feed on response to avoid overfeeding Practice regular flushing of ponds Monitor feed for macro-minerals like phosphorus and nitrogen

Predators	 Sunlight resistant cover netting on aquaculture facilities should be used for keeping predatory birds out; and, for providing shade over the production activities. This netting must be erected and maintained in a manner that does not pose a threat to any birds and other animals. Shade cloth or bird netting must be of such a mesh size, structure and of rigid material so that entrapment or injury of any birds (and other animals) is prevented; Netting must be ultra violet (UV) and weather resistant to prevent it from tearing and becoming tattered; Netting must be firmly secured to prevent it from tearing in windy conditions
HIV/AIDs	 Review the construction activities to integrate with the HIV/AIDS campaigns Develop appropriate training and awareness materials for Information, Education and Communication (IEC) on HIV/AIDS Identify other players (local CBOs, NGOs, and government organizations) on HIV/AIDS for enhanced collaboration Develop an intervention strategy compatible with the construction programme to address success of the HIV/AIDS prevention and provide peer educators for sustainability in collaboration with other stakeholders.

Water Quality Degradation	Soil sampling and trial holes digging will be conducted before excavation for foundations begins and soil information will be provided to excavation crews to inform them about soil conditions and potential hazards. If suspected contaminated groundwater is encountered in the depths of the proposed development, samples will be collected and submitted for laboratory analysis for petroleum hydrocarbons, metals, volatile organic compounds and semi-volatile organic compounds.
Soil pollution	 Provide spill kits on site and train worker on how to use them Provide drip trays where spills are likely to occur from machines and vehicles under repair
Air Pollution: Fumes	 Use of low sulphur diesel for diesel powered vehicles and equipment. Proper maintenance of machinery and vehicles Prohibit open burning of any kind of waste on site
Risk of Occupational accidents and diseases.	 Set up a health and safety committee and periodic site inspections, training and annual safety audits. Provide appropriate PPEs to workers and visitors to the site Adhere to the provisions of the occupational Health and Safety Act of 2007.

Soil erosion during construction	 Put in place soil erosion control measures Limit construction to the project area alone The restoration period will require monitoring of the re- vegetated sites to assess impacts of heavy foraging, patch growth as well as gulley formation. Presence of well rooted vegetation will act as soil stabilization for the areas. Site clearing or disturbance of the natural vegetation will be planned and approved as part of project management process.
Fish mortalities and associated Diseases	 Practice good fish pond husbandry Limit the use of chemicals; Conduct a daily routine of collecting mortalities on the farm All mortalities should be burnt at the incinerator Farmers must maintain suitable environmental conditions, select healthy fish, provide a nutritious diet, limit stress and vaccinate
Land Degradation	 Limit excavations to areas marked for development Apply a layer of selected backfill material on the access roads
Vegetation clearance	Ensure vegetation is only cleared in areas where the pan will be dug and Trees to be protected in- situ to be clearly identified and communicated to the construction staff.
Insecurity	 Employ construction workers who possess valid certificate of good conduct Formulate a comprehensive security plan and implement it. Contract a reputable security firm to be in charge of security at the site. Liaise with the neighbors and the local administration in security management

 Table 1: Summary of Environmental and Social Impact Mitigation Measures

Recommendations

Several measures have been suggested to prevent or minimize the negative environmental and social impacts and to maximize the positive ones using a comprehensive Environmental Management Plan. The measures mainly focus on the following points:-

- Community agreements and negotiations should be formalized before the project start as per the laws of the land when sorting out project implementation disputes
- Use of alternative materials or products which are less damaging to the environment
- Reduction of impacts of waste through minimization of waste generation,
 recycling, reuse and responsible disposal
- Use of appropriate technologies to mitigate environmental impacts of various activities
- Ensuring compliance with relevant safety, health and environmental regulations
- Reduction of exhaust emissions through proper planning of vehicle movements and use of lead free fuel.
- Development of appropriate training and awareness materials for Information, Education and Communication (IEC) on HIV/AIDS

Conclusion

Considering the positive socio-economic and environmental benefits that will accrue as a result of the proposed developments, and the ESIA study having found no major/significant impacts to arise from the development, it is our recommendation that the project be allowed to proceed with the understanding that the proponent will adhere to the mitigation measures recommended herein and will further still implement the proposed Environmental and Social Management Plan (EMP) to the latter. An initial environmental audit will also be carried within a period of 12 months after commencement of the operations to check compliance to the set policies, standards and laws and the proponent will contract a licensed firm to provide Environmental Health and Safety Services for the construction phase of the proposed development
